- **Programmable ROMs Using 21V**
- **Easily Expandable Memory and I/O**
- **Up to 1.36 μs Instruction Cycle All Instructions 1 or 2 Cycles**

1

The Intel MCS®-48 family are totally self-sufficient, 8-bit parallel computers fabricated on single silicon chips using Intel's advanced N-channel silicon gate HMOS process.

The family contains 27 I/O lines, an 8-bit timer/counter, and on-board oscillator/clock circuits. For systems that require extra capability, the family can be expanded using MCS®-80/MCS®-85 peripherals.

These microcontrollers are available in both masked ROM and ROMless versions as well as a new version, The Programmable ROM. The Programmable ROM provides the user with the capability of a masked ROM while providing the flexibility of a device that can be programmed at the time of requirement and to the desired data. Programmable ROM's allow the user to lower inventory levels while at the same time decreasing delay times and code risks.

These microcomputers are designed to be efficient controllers as well as arithmetic processors. They have extensive bit handling capability as well as facilities for both binary and BCD arithmetic. Efficient use of program memory results from an instruction set consisting of mostly single byte instructions and no instructions over 2 bytes in length.

Table 1. Pin Description

Symbol	Pin No.	Function	Device
V_{SS}	20	Circuit GND potential.	All
V_{DD}	26	+5V during normal operation.	All
		Low power standby pin.	8048AH 8035AHL 8049AH 8039AHL 8050AH 8040AHL
		Programming power supply (+21V).	P8748H P8749H
V_{CC}	40	Main power supply; +5V during operation and programming.	All
PROG	25	Output strobe for 8243 I/O expander.	All
		Program pulse (+18V) input pin During Programming.	P8748H P8749H
P10-P17 Port 1	27-34	8-bit quasi-bidirectional port.	All
P20-P23 P24-P27 Port 2	21-24 35-38	8-bit quasi-bidirectional port. P20-P23 contain the four high order program counter bits during an external program memory fetch and serve as a 4-bit I/O expander bus for 8243.	All
DB0-DB7 BUS	12-19	True bidirectional port which can be written or read synchronously using the $\overline{RD}$, $\overline{WR}$ strobes. The port can also be statically latched. Contains the 8 low order program counter bits during an external program memory fetch, and receives the addressed instruction under the control of $\overline{PSEN}$. Also contains the address and data during an external RAM data store instruction, under control of ALE, $\overline{RD}$, and $\overline{WR}$.	All
T0	1	Input pin testable using the conditional transfer instruction JT0 and JNT0. T0 can be designated as a clock output using ENT0 CLK instruction.	All
		Used during programming.	P8748H P8749H

Table 1. Pin Description (Continued)

Symbol	Pin No.	Function	Device
T1	39	Input pin testable using the JT1, and JNT1 instructions. Can be designated the timer/counter input using the STRT CNT instruction.	All
$\overline{INT}$	6	Interrupt input. Initiates an interrupt if interrupt is enabled. Interrupt is disabled after a reset. Also testable with conditional jump instruction. (Active low) interrupt must remain low for at least 3 machine cycles for proper operation.	All
$\overline{RD}$	8	Output strobe activated during a BUS read. Can be used to enable data onto the bus from an external device. Used as a read strobe to external data memory. (Active low)	All
$\overline{RESET}$	4	Input which is used to initialize the processor. (Active low) (Non TTL V_{IH})	All
		Used during power down.	8048AH 8035AHL 8049AH 8039AHL 8050AH 8040AHL
		Used during programming.	P8748H P8749H
		Used during ROM verification.	8048AH P8748H 8049AH P8749H 8050AH
$\overline{WR}$	10	Output strobe during a bus write. (Active low) Used as write strobe to external data memory.	All
ALE	11	Address latch enable. This signal occurs once during each cycle and is useful as a clock output. The negative edge of ALE strobes address into external data and program memory.	All
$\overline{PSEN}$	9	Program store enable. This output occurs only during a fetch to external program memory. (Active low)	All
$\overline{SS}$	5	Single step input can be used in conjunction with ALE to "single step" the processor through each instruction.	All
		(Active low) Used in sync mode.	8048AH 8035AHL 8049AH 8039AHL 8050AH 8040AHL
EA	7	External access input which forces all program memory fetches to reference external memory. Useful for emulation and debug. (Active high)	All
		Used during (18V) programming.	P8748H P8749H
		Used during ROM verification (12V).	8048AH 8049AH 8050AH
XTAL1	2	One side of crystal input for internal oscillator. Also input for external source. (Non TTL V_{IH})	All
XTAL2	3	Other side of crystal input.	All

For XTAL1 and XTAL2 define "high" as voltages above 1.6V and "low" as voltages below 1.6V. The duty cycle requirements for externally driving XTAL1 and XTAL2 using the circuits shown above are as follows: XTAL1 must be high 35–65% of the period and XTAL2 must be high 35–65% of the period. Rise and fall times must be faster than 20 ns.

PROGRAMMING AND VERIFYING THE P8749H/48H PROGRAMMABLE ROM

Programming Verification

In brief, the programming process consists of: activating the program mode, applying an address, latching the address, applying data, and applying a programming pulse. Each word is programmed completely before moving on to the next and is followed by a verification step. The following is a list of the pins used for programming and a description of their functions:

Pin	Function
XTAL1	Clock Input (3 to 4.0 MHz)
XTAL2	
$\overline{\text{RESET}}$	Initialization and Address Latching
T0	Selection of Program or Verifying Mode
EA	Activation of Program/Verify Modes
BUS	Address and Data Input
	Data Output During Verify
P20–P22	Address Input
V_{DD}	Programming Power Supply
PROG	Program Pulse Input

WARNING:

An attempt to program a missocketed P8749H/48H will result in severe damage to the part. An indication of a properly socketed part is the appearance of the ALE clock output. The lack of this clock may be used to disable the programmer.

The Program/Verify sequence is:

1. V_{DD} = 5V, Clock applied or internal oscillator operating, $\overline{\text{RESET}}$ = 0V, T0 = 5V, EA = 5V, BUS and PROG floating. P10 and P11 must be tied to ground.
2. Insert P8749H/48H in programming socket
3. T0 = 0V (select program mode)
4. EA = 18V (activate program mode)
5. Address applied to BUS and P20–22
6. $\overline{\text{RESET}}$ = 5V (latch address)
7. Data applied to BUS
8. V_{DD} = 21V (programming power)
9. PROG = V_{CC} or float followed by one 50 ms pulse to 18V
10. V_{DD} = 5V
11. T0 = 5V (verify mode)
12. Read and verify data on BUS
13. T0 = 0V
14. $\overline{\text{RESET}}$ = 0V and repeat from step 5
15. Programmer should be at conditions of step 1 when P8749H/48H is removed from socket.

NOTE:
Once programmed the P8749H/48H cannot be erased.
