
HA13150A

21 W × 4-Channel BTL Power IC

HITACHI

ADE-207-107
1st. Edition

Description

HA13150A is a four-channel BTL amplifier IC designed for car audio, featuring high output and low distortion, and applicable to digital audio equipment. It provides 21 W output per channel, with a 14.4 V power supply and at 10% distortion.

Functions

- Built-in standby circuit
- Built-in muting circuit
- Built-in protection circuits (surge, TSD, and ASO)

Features

- Requires few external parts
- Low distortion (total harmonic distortion = 0.01% at 3 W)
- Low noise (at $R_g = 620 \Omega$, noise is 0.15 mV (muting off) or 0.1 mV (muting on))
- Popping noise minimized
- Highly reliable current-limiting ASO protector keeps speakers safe from all kinds of trouble. Reliability is further enhanced by a fast-acting thermal shutdown protection circuit with on/off hysteresis.

Point of Application Board Design

1. Notes on Application board's pattern design
 - For increasing stability, the connected line of V_{CC} and OUTGND is better to be made wider and lower impedance.
 - For increasing stability, it is better to place the capacitor between V_{CC} and GND ($0.1 \mu\text{F}$) close to IC.
 - For increasing stability, it is better to place C1 to C8 and R1 to R8, which are for stopping oscillation, close to IC.
 - It is better to place the grounding of resistor (R_g), between input line and ground, close to INGND (Pin 12) because if OUTGND is connected to the line between R_g and INGND, THD will become worse due to current from OUTGND.

2. How to reduce the popping noise by Muting circuit

At normal operating circuit, Muting circuit operates at high speed under 1 μ s.

In case popping noise becomes a problem, it is possible to reduce the popping noise by connecting capacitor, which determines the switching time constant, between pin 10 and GND. (Following figure 2)

We recommend value of capacitor greater than 1 μ F.

Also transitional popping noise can be reduced sharply by muting before V_{CC} and Standby are ON/OFF.

C (μ F)	ON Time	OFF Time
nothing	under 1 μ s	under 1 μ s
0.47	2 ms	2 ms
4.7	19 ms	19 ms
