**CURRENT MODE  
REGULATING  
PULSE WIDTH  
MODULATORS**

**FEATURES**

- Guaranteed  $\pm 1\%$  reference voltage tolerance
- Guaranteed  $\pm 10\%$  frequency tolerance
- Low start-up current ( $< 500 \mu A$ )
- Under voltage lockout with hysteresis
- Output state completely defined for all supply and input conditions
- Interchangeable with UC1844 and UC1845 series for improved operation
- 500kHz Oscillator operation  
250kHz Output operation

**DESCRIPTION**

The IP1844 and IP1845 series of switching regulator control circuits contain all the functions necessary to implement off-line, current mode switching regulators, using a minimum number of external parts.

Functions included are voltage reference, error amplifier, current sense comparator, oscillator, totem-pole output driver and under-voltage lockout circuitry. In addition there is a toggle flip-flop which blanks the output on every second clock pulse, thereby ensuring that the duty cycle never exceeds 50%.

Although pin compatible with the UC1844 and UC1845 series, SEMELAB has incorporated several improvements in the IP1844 and IP1845 series allowing tighter and more complete specification of electrical performance .

**NOTES**

1. Test Conditions unless otherwise stated:

V<sub>CC</sub> = 15V\*, R<sub>T</sub> = 10kΩ, C<sub>T</sub> = 3.3nF, f = 52kHz.

\*Adjust V<sub>CC</sub> above start threshold before setting at required level.

2. Parameter measured at trip point of latch with

V<sub>PIN2</sub> = 0V

3. Gain defined as:

$$A = \frac{\Delta V_{PIN1}}{\Delta V_{PIN3}}$$

$$0 \leq V_{PIN3} \leq 0.8$$

All specifications apply over the full operating temperature range unless otherwise stated.

(See Ordering Information for further details).

**APPLICATIONS INFORMATION**

**Oscillator Waveforms and Maximum Duty Cycle**

Oscillator timing capacitor  $C_T$  is charged by  $V_{REF}$  through  $R_T$  and discharged by an internal current source. During the discharge time, the internal clock signal blanks the output to the low state. Selection of  $R_T$  and  $C_T$  therefore determines both oscillator frequency and maximum duty cycle.

Charge and discharge times are determined by the formulae:

$$t_c \approx 0.55 R_T C_T$$

For  $R_T > 5k\Omega$ ,

$$t_d \approx R_T C_T \ln \left( \frac{.0063 R_T - 2.3}{.0063 - 4} \right)$$

$$\text{Resultant frequency } f \approx \frac{1.8}{(R_T C_T)}$$

$$\text{Resultant frequency } f = \frac{1}{(t_c + t_d)}$$

**APPLICATIONS INFORMATION**

**Open-Loop Laboratory Test Fixture**

High peak current associated with capacitive loads necessitate careful grounding techniques. Timing and bypass capacitors should be connected close to pin 5 in a single point ground. The transistor and 5K potentiometer are used to sample the oscillator wave form and apply an adjustable ramp to pin 3.

**TYPICAL PERFORMANCE CHARACTERISTICS**
