

# 1Mbps, 1 $\mu$ A RS-232 Transmitters in SOT23-6

MAX3188/MAX3189

## General Description

The MAX3188/MAX3189 single RS-232 transmitters in a SOT23-6 package are for space- and cost-constrained applications requiring minimal RS-232 communications. These devices consume only 150 $\mu$ A of supply current from  $\pm$ 4.5V to  $\pm$ 6V supplies. RS-232 data transmission is guaranteed up to 250kbps with the MAX3188 and up to 1Mbps with the MAX3189.

The MAX3188/MAX3189 transmitters are inverting level translators that convert CMOS-logic levels to 5V EIA/TIA-232 levels. They feature a shutdown input that reduces current consumption to only 1 $\mu$ A and forces the transmitter output into a high-impedance state. The MAX3188/MAX3189 transmitters have a standard inverting output.

## Features

- ◆ Small 6-Pin SOT23 Package
- ◆ 150 $\mu$ A Supply Current
- ◆ Shutdown Reduces Supply Current to 1 $\mu$ A
- ◆ Guaranteed Data Rate  
1Mbps (MAX3189)  
250kbps (MAX3188)
- ◆ Three-State RS-232 Transmitter Output
- ◆ No External Components Required

## Applications

**Note 1:** V<sub>CC</sub> and V<sub>EE</sub> can have maximum magnitudes of 7V, but their absolute difference cannot exceed 13V.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## Pin Description

PIN	NAME	FUNCTION
1	$\overline{\text{SHDN}}$	Active-Low Shutdown. Pull low to reduce the supply current and to force TOUT into a high-impedance state.
2	GND	Ground
3	TIN	TTL/CMOS Transmitter Input
4	TOUT	RS-232 Transmitter Output
5	VEE	Negative Supply Voltage
6	VCC	Positive Supply Voltage

## Detailed Description

The transmitter is an inverting level translator that converts CMOS-logic levels to 5V EIA/TIA-232 levels. The MAX3188 guarantees a 250kbps data rate, and the MAX3189 guarantees a 1Mbps data rate with worst-case loads of 3k $\Omega$  in parallel with 1000pF. The transmitter input does not have a pull-up resistor and should be connected to GND if unused.

### Shutdown

The MAX3188/MAX3189 feature a shutdown input. Drive  $\overline{\text{SHDN}}$  low to reduce the supply current to 1 $\mu$ A (max). Shutdown also forces TOUT into a high-impedance state that allows the signal line to be safely controlled by other transmitters. Drive  $\overline{\text{SHDN}}$  high for normal operation.

### Power-Supply Decoupling

In most circumstances, 0.1 $\mu$ F bypass capacitors are adequate for power-supply decoupling. Connect the bypass capacitors as close to the IC as possible.

## Applications Information

### Power-Supply Sources

The MAX3188/MAX3189 require  $\pm 4.5\text{V}$  to  $\pm 6\text{V}$  dual supplies. For applications where these supply voltages are not present, a DC-DC converter must be added. Due to the devices' low current consumption, a charge pump can provide the proper supply voltages and requires a minimal amount of board space and cost.

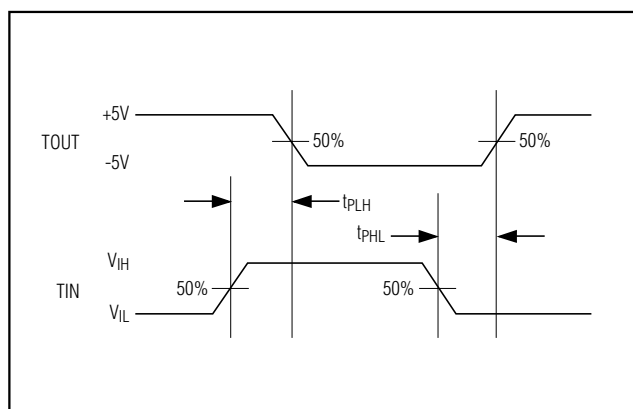

Figure 1. Transmitter Propagation-Delay Timing

When using another RS-232 device containing an internal regulated charge pump (Table 1), the MAX3188/MAX3189 may be powered from the internal charge pump (Figure 2). This eliminates the need for additional external DC-DC converters to generate the required  $\pm 4.5\text{V}$  to  $\pm 6\text{V}$  dual supplies.
