

NDT410EL

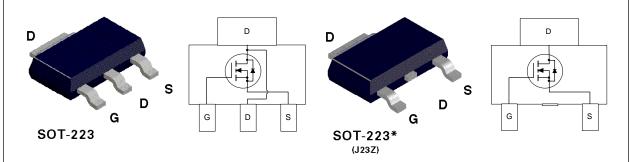

N-Channel Logic Level Enhancement Mode Field Effect Transistor

General Description

Power SOT N-Channel logic level enhancement mode power field effect transistors are produced using Fairchild's proprietary, high cell density, DMOS technology. This very high density process is especially tailored to minimize on-state resistance, provide superior switching performance, and withstand high energy pulses in the avalanche and commutation modes. These devices are particularly suited for low voltage applications such as automotive, DC/DC converters, PWM motor controls, and other battery powered circuits where fast switching, low in-line power loss, and resistance to transients are needed.

Features

- $\qquad \qquad 2.1 \text{A 100V. } \text{R}_{\text{DS(ON)}} = 0.25 \Omega \ \, @ \, \, \text{V}_{\text{GS}} = 5 \text{V}.$
- High density cell design for extremely low R_{DS(ON)}.
- High power and current handling capability in a widely used surface mount package.

ABSOLUTE MAXIMUM RATINGS $T_A = 25$ °C unless otherwise noted

Notes:

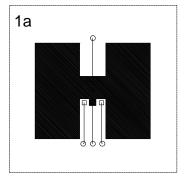

1. $R_{\text{Bu,k}}$ is the sum of the junction-to-case and case-to-ambient thermal resistance where the case thermal reference is defined as the solder mounting surface of the drain pins. $R_{\text{Bu,c}}$ is guaranteed by design while $R_{\text{gc,h}}$ is determined by the user's board design. $P_D(t) = \frac{T_J - T_A}{R_{\text{Bu,f}}} = \frac{T_J - T_A}{R_{\text{Bu,f}}} = I_D^2(t) \times R_{DS(ON)@T_J}$ Typical $R_{\text{Bu,h}}$ using the board layouts shown below on 4.5°x5° FR-4 PCB in a still air environment:

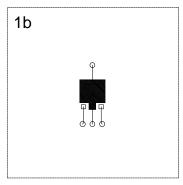

a. 42°C/W when mounted on a 1 in² pad of 2oz copper.

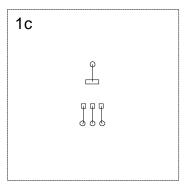

b. 95°C/W when mounted on a 0.04 in² pad of 2oz copper.

$$P_D(t) = \frac{I_J - I_A}{R_{DL}(t)} = \frac{I_J - I_A}{R_{DL} + R_{DL}(t)} = I_D^2(t) \times R_{DS(ON)@T_J}$$

- c. 110°C/W when mounted on a 0.006 in² pad of 2oz copper.
