

UTC TA31002 LINEAR INTEGRATED CIRCUIT

TELEPHONE TONE RINGER

DESCRIPTION

The UTC TA31002 is a bipolar integrated circuit designed for telephone bell replacement. It can also be used as alarms or other alerting devices.

FEATURES

- *Current consumption is small. (at no-load)
- *Package is compaction. (DIP-8 pin)
- *Oscillation frequency is variable.
- *Built-in threshold circuits prevent false triggering due to power noise as well as "chirps" due to rotary dial.
- *Few external componens.

- *NOTE : 1. Initiation supply voltage (Vsi) is a supply voltage required to start oscillation of the tone ringer.
 2. Sustaining supply voltage (Vsus) is a supply voltage required to maintain oscillation of the tone ringer.
 3. Oscillation frequency is determined by the following equations 1,2,and 3.
 (1) $f_L = 1/1.234 \cdot R1 \cdot C1$ (Hz) ; (2) $f_{H1} = 1/1.515 \cdot R2 \cdot C2$ (Hz); (3) $f_{H2} = 1.24 f_{H1}$ (Hz)

APPLICATION NOTE

In the TA31002 the initiation current consumption (I_{si}) can be changed by using the RSL terminal. The resistor RSL is connected to GND from PIN2 as shown in fig.1. Further, the initiation current consumption (I_{si}) can be changed by changing the value of RSL.

Fig.2 show the graph of V_s - I_s characteristic at the time when RSL has been changed to three values. The V_s - I_s characteristic in TA31002 at the time when RSL=6.8k Ω coincides with that at the time when PIN2 of the TA31001 has been used at an open state.
