

# Off-Line Current Mode PWM Control Circuit with Undervoltage Lockout

## Description

The CS284XA, CS384XA provides all the necessary features to implement off-line fixed frequency current-mode control with a minimum number of external components.

The CS384XA family incorporates a new precision temperature-controlled oscillator with an internally trimmed discharge current to minimize variations in frequency. A precision duty-cycle clamp eliminates the need for an external oscillator when a 50% duty-cycle is used. Duty-cycles greater than 50% are also possible. On board logic ensures that  $V_{REF}$  is stabilized before

the output stage is enabled. Ion implant resistors provide tighter control of undervoltage lockout.

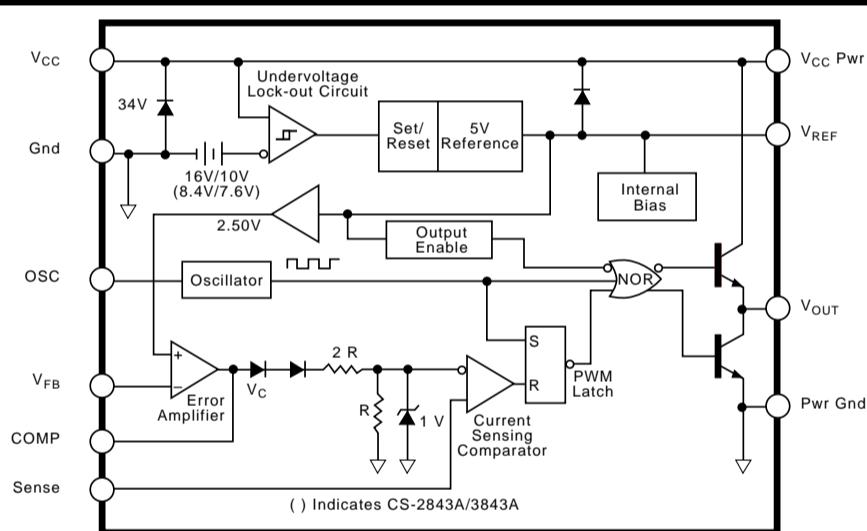

Other features include low start-up current, pulse-by-pulse current limiting, and a high-current totem pole output for driving capacitive loads, such as the gate of power MOSFET. The output is LOW in the off state, consistent with N-channel devices.

The CS384XA series of current-mode control ICs are available in 8 and 14 lead packages for surface mount (SO) applications as well as 8 lead PDIP packages.

## Absolute Maximum Ratings

Supply Voltage ( $I_{CC} < 30\text{mA}$ ).....	Self Limiting
Supply Voltage (Low Impedance Source) .....	30V
Output Current.....	$\pm 1\text{A}$
Output Energy (Capacitive Load).....	$5\mu\text{J}$
Analog Inputs ( $V_{FB}$ , Sense).....	-0.3V to 5.5V
Error Amp Output Sink Current .....	10mA
Lead Temperature Soldering	
Wave Solder (through hole styles only) .....	10 sec. max, 260°C peak
Reflow (SMD styles only) .....	60 sec. max above 183°C, 230°C peak

## Block Diagram

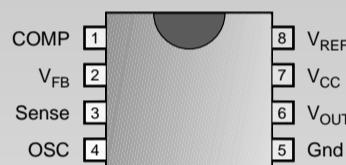

## Features

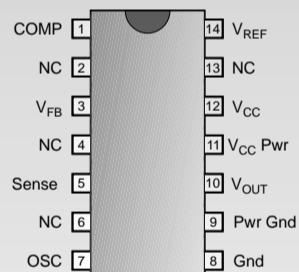

- Optimized for Off-line Control
- Internally Trimmed Temperature Compensated Oscillator
- Maximum Duty-cycle Clamp
- $V_{REF}$  stabilized before Output Stage is Enabled
- Low Start-up Current
- Pulse-by-pulse Current Limiting
- Improved Undervoltage Lockout
- Double Pulse Suppression
- 1% Trimmed Bandgap Reference
- High Current Totem Pole Output

## Package Options

### 8 Lead PDIP & SO Narrow

### 14 Lead SO Narrow

- Notes:** 1. Adjust  $V_{\text{CC}}$  above the start threshold before setting at 15V.  
 2. These parameters, although guaranteed, are not 100% tested in production.

3. Parameter measured at trip point of latch with  $V_{\text{FB}}=0$ .

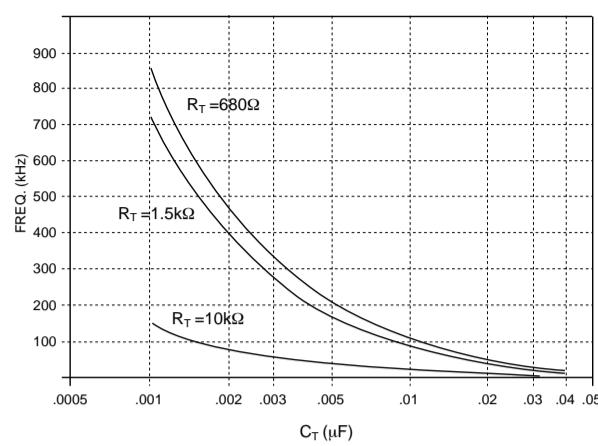

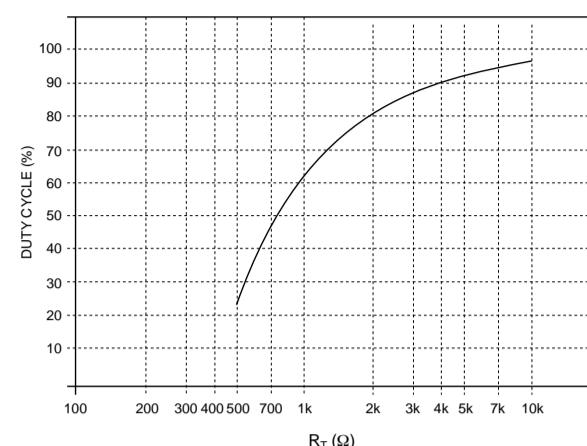

4. Gain defined as:

$$A = \frac{\Delta V_{\text{COMP}}}{\Delta V_{\text{Sense}}} ; 0 \leq V_{\text{Sense}} \leq 0.8\text{V}.$$

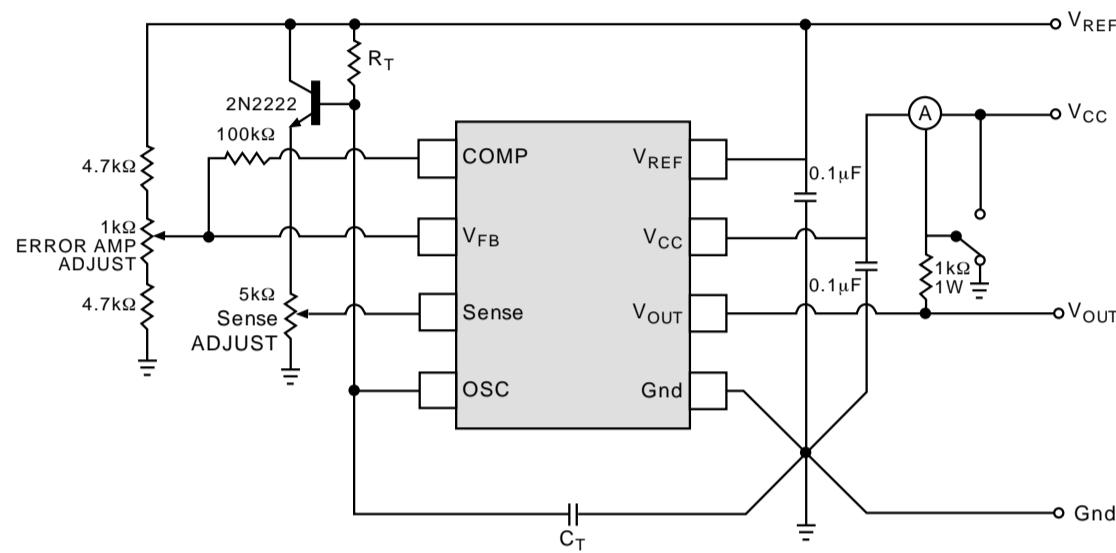

### Package Pin Description

PACKAGE PIN #	PIN SYMBOL	FUNCTION	
<b>8L PDIP/SO</b>	<b>14L SO Narrow</b>		
1	1	COMP	Error amp output, used to compensate error amplifier
2	3	$V_{\text{FB}}$	Error amp inverting input
3	5	Sense	Noninverting input to Current Sense Comparator
4	7	OSC	Oscillator timing network with Capacitor to Ground, resistor to $V_{\text{REF}}$
5	8	Gnd	Ground
	9	Pwr Gnd	Output driver Ground
6	10	$V_{\text{OUT}}$	Output drive pin
	11	$V_{\text{CCPwr}}$	Output driver positive supply
7	12	$V_{\text{CC}}$	Positive power supply
8	14	$V_{\text{REF}}$	Output of 5V internal reference
2,4,6,13		NC	No Connection

## Typical Performance Characteristics

Oscillator Frequency vs  $C_T$ Oscillator Duty Cycle vs  $R_T$ 

Test Circuit

Circuit Description

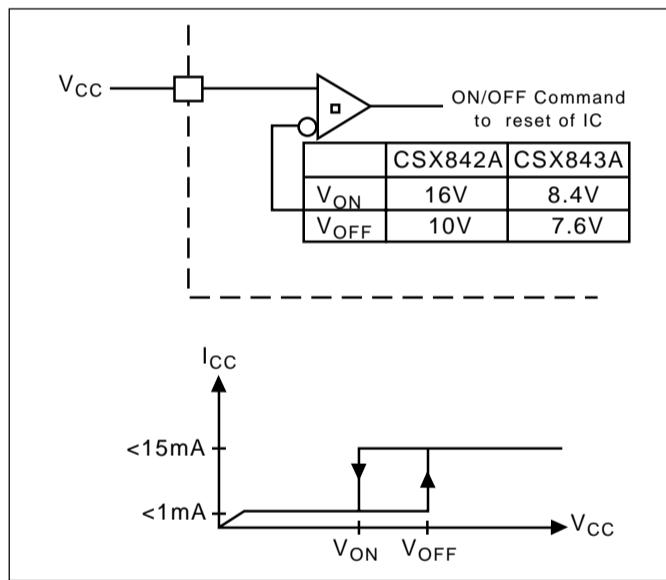

Figure 1: Typical Undervoltage Characteristics

**Undervoltage Lockout**

During Undervoltage Lockout (Figure 1), the output driver is biased to a high impedance state. The output should be shunted to ground with a resistor to prevent output leakage current from activating the power switch.

**PWM Waveform**

To generate the PWM waveform, the control voltage from the error amplifier is compared to a current sense signal which represents the peak output inductor current (Figure 2). An increase in  $V_{CC}$  causes the inductor current slope to increase, thus reducing the duty cycle. This is an inherent feed-forward characteristic of current mode control, since the control voltage does not have to change during changes of input supply voltage.

When the power supply sees a sudden large output current increase, the control voltage will increase allowing the duty cycle to momentarily increase. Since the duty cycle tends to exceed the maximum allowed to prevent trans-

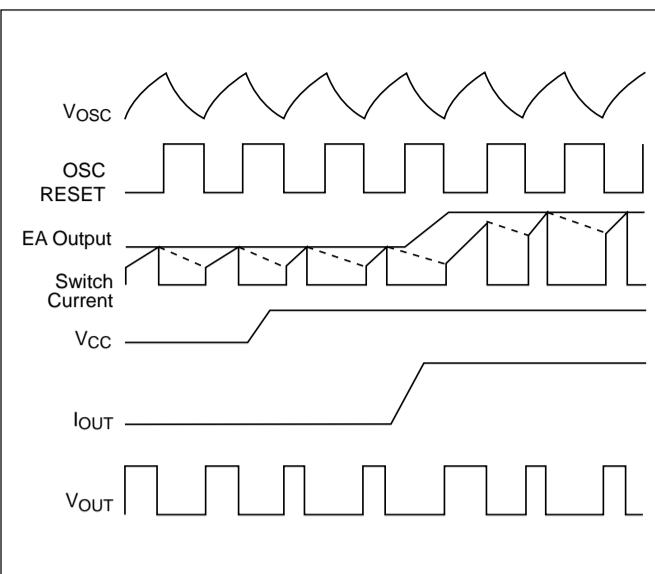

Figure 2: Timing Diagram for key CS2841B parameters

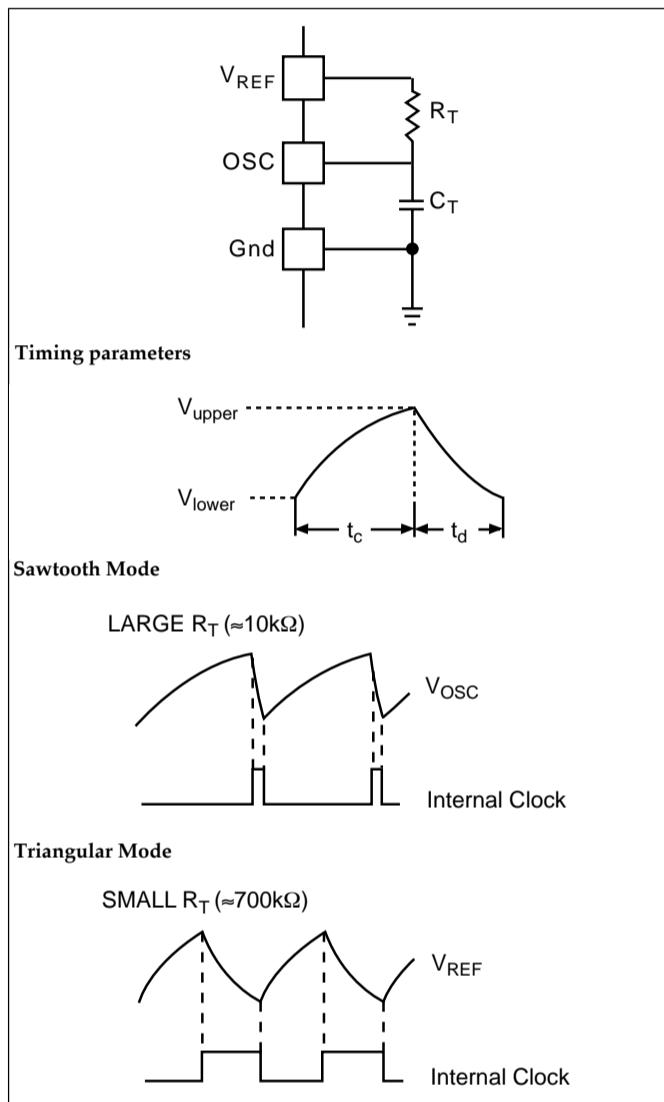

Figure 3: Oscillator Timing Network and parameters

former saturation in some power supplies, the internal oscillator waveform provides the maximum duty cycle clamp as programmed by the selection of oscillator components.

### Setting the Oscillator

Oscillator timing capacitor,  $C_T$ , is charged by  $V_{REF}$  through  $R_T$  and discharged by an internal current source. During the discharge time, the internal clock signal blanks out the output to the Low state, thus providing a user selected maximum duty cycle clamp. Charge and discharge times are determined by the formula:

$$t_c = R_T C_T \ln \left( \frac{V_{REF} - V_{lower}}{V_{REF} - V_{upper}} \right)$$

$$t_d = R_T C_T \ln \left( \frac{V_{REF} - I_d R_T - V_{lower}}{V_{REF} - I_d R_T - V_{upper}} \right)$$

Substituting in typical values for the parameters in the above formulas:

$$V_{REF} = 5.0V, V_{upper} = 2.7V, V_{lower} = 1.0V, I_d = 8.3mA$$

$$t_c \approx 0.5534 R_T C_T$$

$$t_d = R_T C_T \ln \left( \frac{2.3 - 0.0083 R_T}{4.0 - 0.0083 R_T} \right)$$

The frequency and maximum duty cycle can be determined using the Typical Performance Characteristic graphs.

### Grounding

High peak currents associated with capacitive loads necessitate careful grounding techniques. Timing and bypass capacitors should be connected close to Gnd pin in a single point ground.

The transistor and 5kΩ potentiometer, shown in the test circuit, are used to sample the oscillator waveform and apply an adjustable ramp to Sense.

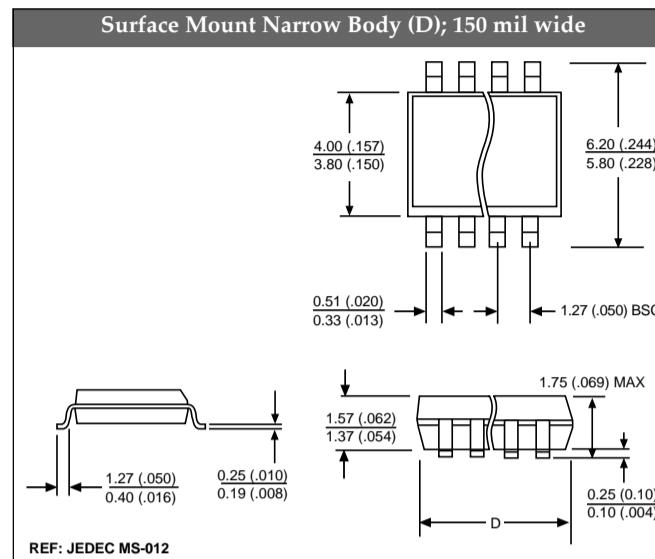

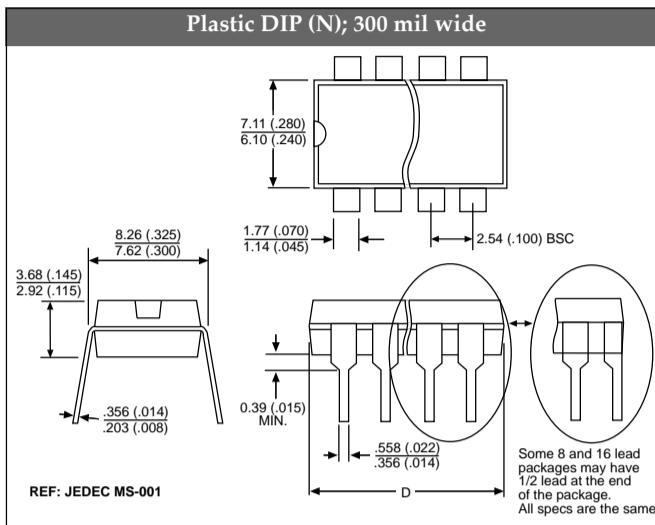

## Package Specification
