MC54/74HC139A

Dual 1-of-4 Decoder/ Demultiplexer

High–Performance Silicon–Gate CMOS

The MC54/74HC139A is identical in pinout to the LS139. The device inputs are compatible with standard CMOS outputs; with pullup resistors, they are compatible with LSTTL outputs.

This device consists of two independent 1–of–4 decoders, each of which decodes a two–bit Address to one–of–four active–low outputs. Active–low Selects are provided to facilitate the demultiplexing and cascading functions. The demultiplexing function is accomplished by using the Address inputs to select the desired device output, and utilizing the Select as a data input.

- Output Drive Capability: 10 LSTTL Loads
- Outputs Directly Interface to CMOS, NMOS and TTL
- Operating Voltage Range: 2.0 to 6.0 V
- Low Input Current: 1.0 μA
- High Noise Immunity Characteristic of CMOS Devices
- In Compliance with the Requirements Defined by JEDEC Standard No. 7A
- Chip Complexity: 100 FETs or 25 Equivalent Gates

This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high–impedance circuit. For proper operation, V_{in} and V_{out} should be constrained to the range GND ≤ (V_{in} or V_{out}) ≤ V_{CC}.

Unused inputs must always be tied to an appropriate logic voltage level (e.g., either GND or V_{CC}). Unused outputs must be left open.

* Maximum Ratings are those values beyond which damage to the device may occur.
Functional operation should be restricted to the Recommended Operating Conditions.

†Derating — Plastic DIP: – 10 mW/°C from 65° to 125°C
Ceramic DIP: – 10 mW/°C from 100° to 125°C
SOIC Package: – 7 mW/°C from 65° to 125°C

For high frequency or heavy load considerations, see Chapter 2 of the Motorola High–Speed CMOS Data Book (DL129/D).

PIN DESCRIPTIONS

ADDRESS INPUTS

$A0_a$, $A1_a$, $A0_b$, $A1_b$ (Pins 2, 3, 14, 13)

Address inputs. These inputs, when the respective 1–of–4 decoder is enabled, determine which of its four active–low outputs is selected.

CONTROL INPUTS

$Select_a$, $Select_b$ (Pins 1, 15)

Active–low select inputs. For a low level on this input, the outputs for that particular decoder follow the Address inputs. A high level on this input forces all outputs to a high level.

OUTPUTS

$Y0_a$ – $Y3_a$, $Y0_b$ – $Y3_b$ (Pins 4 – 7, 12, 11, 10, 9)

Active–low outputs. These outputs assume a low level when addressed and the appropriate Select input is active. These outputs remain high when not addressed or the appropriate Select input is inactive.
