## 4-BIT SINGLE-CHIP MICROCONTROLLER

## DESCRIPTION

The $\mu$ PD753017A is one of the 75XL series 4-bit single-chip microcontroller chips and has a data processing capability comparable to that of an 8 -bit microcontroller.

It has an on-chip LCD controller/driver with a larger ROM capacity and extended CPU functions compared with the conventional $\mu$ PD75316B, and can provide high-speed operation at a low supply voltage of 1.8 V . It can be supplied in a small plastic TQFP package ( $12 \times 12 \mathrm{~mm}$ ) and is suitable for small sets using LCD panels.

Detailed descriptions of functions are provided in the following document. Be sure to read the document before designing.

$$
\mu \text { PD753017 User's Manual : U11282E }
$$

## FEATURES

- Low voltage operation: $\mathrm{VDD}=1.8$ to 5.5 V
- Can be driven by two 1.5 V batteries
- On-chip memory
- Program memory (ROM):
$12288 \times 8$ bits ( $\mu$ PD753012A) $16384 \times 8$ bits ( $\mu$ PD753016A) $24576 \times 8$ bits ( $\mu$ PD753017A)
- Data memory (RAM): $1024 \times 4$ bits
- Capable of high-speed operation and variable instruction execution time for power saving
- $0.95,1.91,3.81,15.3 \mu \mathrm{~s}$ (at 4.19 MHz operation)
- $0.67,1.33,2.67,10.7 \mu \mathrm{~s}$ (at 6.0 MHz operation)
- $122 \mu \mathrm{~s}$ (at 32.768 kHz operation)
- Internal programmable LCD controller/driver
- Small plastic TQFP ( $12 \times 12 \mathrm{~mm}$ )
- Suitable for small sets such as cameras
- One-time PROM: $\mu$ PD75P3018A

## APPLICATION

Remote controllers, camera-integrated VCRs, cameras, gas meters, etc.

In this document, unless otherwise specified, the description is made based on $\mu$ PD753017A as typical product.

The information in this document is subject to change without notice. Before using this document, please confirm that this is the latest version.
Not all devices/types available in every country. Please check with local NEC representative for availability and additional information.

## ORDERING INFORMATION

## 3. PIN FUNCTION

### 3.1 Port Pins (1/2)

| Pin Name | I/O | Alternate Function | Function | 8-bit I/O | After Reset | I/O Circuit Type ${ }^{\text {Note }} 1$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| P00 | Input | INT4 | 4-bit input port (PORTO). <br> For P01 to P03, connection of on-chip pullup resistors can be specified by software in 3-bit units. | No | Input | <B> |
| P01 |  | $\overline{\text { SCK }}$ |  |  |  | $<\mathrm{F}>-\mathrm{A}$ |
| P02 |  | SO/SB0 |  |  |  | $<\mathrm{F}>-\mathrm{B}$ |
| P03 |  | SI/SB1 |  |  |  | $<\mathrm{M}>-\mathrm{C}$ |
| P10 | Input | INTO | 4-bit input port (PORT1). <br> Connection of on-chip pull-up resistors can be specified by software in 4-bit units. <br> Only P10/INT0 can select noise elimination circuit. | No | input | $<\mathrm{B}>-\mathrm{C}$ |
| P11 |  | INT1 |  |  |  |  |
| P12 |  | TI1/TI2/INT2 |  |  |  |  |
| P13 |  | TIO |  |  |  |  |
| P20 | I/O | PTO0 | 4-bit input/output port (PORT2). <br> Connection of on-chip pull-up resistors can be specified by software in 4-bit units. | No | Input | E-B |
| P21 |  | PTO1 |  |  |  |  |
| P22 |  | PCL/PTO2 |  |  |  |  |
| P23 |  | $B \cup Z$ |  |  |  |  |
| P30 | 1/O | LCDCL | Programmable 4-bit input/output port (PORT3). <br> This port can be specified for input/output bit-wise. <br> Connection of on-chip pull-up resistor can be specified by software in 4-bit units. | No | Input | E-B |
| P31 |  | SYNC |  |  |  |  |
| P32 |  | - |  |  |  |  |
| P33 |  | - |  |  |  |  |
| P40-P43 ${ }^{\text {Note }} 2$ | I/O | - | N-ch open-drain 4-bit input/output port (PORT4). <br> A pull-up resistor can be contained bit-wise (mask option). <br> Withstand voltage is 13 V in open-drain mode. | Yes | High level (when pullup resistors are provided) or high impedance | M-D |
| P50-P53 ${ }^{\text {Note } 2}$ | 1/O | - | N-ch open-drain 4-bit input/output port (PORT5). <br> A pull-up resistor can be contained bit-wise (mask option). <br> Withstand voltage is 13 V in open-drain mode. |  | High level (when pullup resistors are provided) or high impedance | M-D |

Notes 1. Circuit types enclosed in brackets indicate the Schmitt trigger input.
2. If on-chip pull-up resistors are not specified by mask option (when used as N -ch open-drain input port), low level input leakage current increases when input or bit manipulation instruction is executed.

### 3.1 Port Pins (2/2)

| Pin Name | I/O | Alternate Function | Function | $\left\lvert\, \begin{gathered} \text { 8-bit } \\ \text { I/O } \end{gathered}\right.$ | After Reset | I/O Circuit Type ${ }^{\text {Note }} 1$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| P60 | I/O | KR0 | Programmable 4-bit input/output port (PORT6). <br> This port can be specified for input/output bit-wise. <br> Connection of on-chip pull-up resistors can be specified by software in 4-bit units. | Yes | Input | <F>-A |
| P61 |  | KR1 |  |  |  |  |
| P62 |  | KR2 |  |  |  |  |
| P63 |  | KR3 |  |  |  |  |
| P70 | I/O | KR4 | 4-bit input/output port (PORT7). <br> Connection of on-chip pull-up resistors can be specified by software in 4-bit units. |  | Input | <F>-A |
| P71 |  | KR5 |  |  |  |  |
| P72 |  | KR6 |  |  |  |  |
| P73 |  | KR7 |  |  |  |  |
| BP0 | Output | S24 | 1-bit output port (BIT PORT). <br> Also used for segment output pins. | No | Note 2 | H-A |
| BP1 |  | S25 |  |  |  |  |
| BP2 |  | S26 |  |  |  |  |
| BP3 |  | S27 |  |  |  |  |
| BP4 | Output | S28 |  |  |  |  |
| BP5 |  | S29 |  |  |  |  |
| BP6 |  | S30 |  |  |  |  |
| BP7 |  | S31 |  |  |  |  |

Notes 1. Circuit types enclosed in brackets indicate the Schmitt trigger input.
2. BP0 through BP7 select VLC1 as an input source.

However, the output levels change depending on the external circuit of BP0 through BP7 and VLc1.

Example Because BP0 through BP7 are mutually connected inside the $\mu$ PD753017A, the output levels of BP0 through BP7 are determined by $R_{1}, R_{2}$, and $R_{3}$.

### 3.2 Non-port Pins (1/2)

| Pin Name | 1/O | Alternate Function | Function |  | After Reset | I/O Circuit Type ${ }^{\text {Note }} 1$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| TIO | Input | P13 | Inputs external event pulses to the timer/event counter. |  | Input | $<B>-C$ |
| TI1 |  | P12/INT2 |  |  |  |  |
| TI2 |  |  |  |  |  |  |
| PTO0 | Output | P20 | Timer/event counter output |  | Input | E-B |
| PTO1 |  | P21 |  |  |  |  |
| PTO2 |  | P22/PCL |  |  |  |  |
| PCL |  | P22/PTO2 | Clock output |  |  |  |
| BUZ |  | P23 | Optional frequency output (for buzzer output or system clock trimming) |  |  |  |
| $\overline{\text { SCK }}$ | 1/0 | P01 | Serial clock input/output |  | Input | <F>-A |
| SO/SB0 |  | P02 | Serial data output <br> Serial data bus input/output |  |  | <F>-B |
| SI/SB1 |  | P03 | Serial data input <br> Serial data bus input/output |  |  | <M>-C |
| INT4 | Input | P00 | Edge detection vectored interrupt input (both rising edge and falling edge detection) |  | Input | <B> |
| INTO | Input | P10 | Edge detection vectored interrupt input (detection edge can be selected) <br> INT0/P10 can select noise elimination circuit. | Noise elimination circuit/asynchronous selection | Input | $<\mathrm{B}>-\mathrm{C}$ |
| INT1 |  | P11 |  | Asynchronous |  |  |
| INT2 | Input | P12/TI1/TI2 | Rising edge detection testable input | Asynchronous | Input | <B>-C |
| KR0-KR3 | Input | P60-P63 | Falling edge detection testable input |  | Input | $<\mathrm{F}>-\mathrm{A}$ |
| KR4-KR7 | Input | P70-P73 | Falling edge detection testable input |  | Input | <F>-A |
| S0-S23 | Output | - | Segment signal output |  | Note 2 | G-A |
| S24-S31 | Output | BP0-BP7 | Segment signal output |  | Note 2 | H-A |
| COMO-COM3 | Output | - | Common signal output |  | Note 2 | G-B |
| VLCo-VLC2 | - | - | LCD drive power On-chip split resistor is enable (mask option). |  | - | - |
| BIAS | Output | - | Output for external split resistor disconnect |  | Note 3 | - |
| LCDCL ${ }^{\text {Note } 4}$ | Output | P30 | Clock output for externally expanded driver |  | Input | E-B |
| SYNC ${ }^{\text {Note }} 4$ | Output | P31 | Clock output for externally expanded driver synchronization |  | Input | E-B |

Notes 1. Circuit types enclosed in brackets indicate the Schmitt trigger input.
2. Each display output selects the following VLCx as input source.

S0-S31: Vlc1, COM0-COM2: Vlc2, COM3: Vlco
3. When a split resistor is contained ....... Low level

When no split resistor is contained ..... High impedance
4. These pins are provided for future system expansion. At present, these pins are used only as pins P30 and P31.

### 3.2 Non-port Pins (2/2)

| Pin Name | 1/O | Alternate Function | Function | After Reset | I/O Circuit Type ${ }^{\text {Note }}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| X1 | Input | - | Crystal/ceramic connection pin for the mainsystem clock oscillation. When inputting the external clock, input the external clock to pin X1, and the inverted phase of the external clock to pin X2. | - | - |
| X2 | - | - |  |  |  |
| XT1 | Input | - | Crystal connection pin for the subsystem clock oscillation. When the external clock is used, input the external clock to pin XT1, and the inverted phase of the external clock to pin XT2. Pin XT1 can be used as a 1-bit input (test) pin. | - | - |
| XT2 | - |  |  |  |  |
| RESET | Input | - | System reset input (low level active) | - | <B> |
| IC | - | - | Internally connected. Connect directly to Vdo. | - | - |
| V ${ }_{\text {DD }}$ | - | - | Positive power supply | - | - |
| Vss | - | - | GND | - | - |

Note Circuit types enclosed in brackets indicate the Schmitt trigger input.

### 3.3 Pin Input/Output Circuits

The $\mu$ PD753017A pin input/output circuits are shown schematically.
TYPE A

### 3.4 Recommended Connection for Unused Pins

Table 3-1. List of Recommended Connection for Unused Pins

| Pin | Recommended Connection |
| :---: | :---: |
| P00/INT4 | Connect to Vss or Vdd |
| P01/SCK | Connect to Vss or Vod via a resistor individually |
| P02/SO/SB0 |  |
| P03/SI/SB1 | Connect to Vss |
| P10/INT0, P11/INT1 | Connect to Vss or Vdd |
| P12/TI1/TI2/INT2 |  |
| P13/TI0 |  |
| P20/PTO0 | Input: Connect to Vss or Vdd via a resistor individually Output: Leave open |
| P21/PTO1 |  |
| P22/PTO2/PCL |  |
| P23/BUZ |  |
| P30/LCDCL |  |
| P31/SYNC |  |
| P32 |  |
| P33 |  |
| P40-P43 | Input: Connect to Vss <br> Output: Connect to Vss (do not connect a pull-up resistor of mask option) |
| P50-P53 |  |
| P60/KR0-P63/KR3 | Input: Connect to Vss or Vdd via a resistor individually <br> Output: Leave open |
| P70/KR4-P73/KR7 |  |
| S0-S23 | Leave open |
| S24/BP0-S31/BP7 |  |
| COM0-COM3 |  |
| V Lco-Vlc2 | Connect to Vss |
| BIAS | Only if all of VLco-VLC2 are unused, connect to V ${ }_{\text {Ss }}$. In other cases, leave open. |
| XT1 | Connect to Vss |
| XT2 ${ }^{\text {Note }}$ | Leave open |
| IC | Connect to Vod directly |

Note When the subsystem clock is not used, set SOS. 0 to 1 (so as not to use the internal feedback resistor).

## 4. SWITCHING FUNCTION BETWEEN MkI MODE AND Mk II MODE

### 4.1 Differences between Mk I Mode and Mk II Mode

The CPU of $\mu$ PD753017A has the following two modes: Mk I and Mk II, either of which can be selected. The mode can be switched by the bit 3 of the stack bank select register (SBS).

- Mk I mode: Upward compatible with $\mu$ PD75316B.

Can be used in the 75 XL CPU with a ROM capacity of up to 16 K bytes.

- Mk II mode: Incompatible with $\mu$ PD75316B.

Can be used in all the 75XL CPU's including those products whose ROM capacity is more than 16K bytes.

Table 4-1. Differences between Mk I Mode and Mk II Mode

|  | Mk I Mode | Mk II Mode |
| :--- | :--- | :--- |
| Program memory (bytes) | $\bullet \mu \mathrm{PD} 753012 \mathrm{~A}: 12288$ <br>  | $\cdot \mu \mathrm{PD} 753016 \mathrm{~A}, 753017 \mathrm{~A}: 16384$ <br> $\bullet$ |
| Number of stack bytes <br> for subroutine instructions | 2 bytes | $\mu \mathrm{PD} 753017 \mathrm{~A}: 12288$ |
| BRA !addr1 instruction <br> CALLA !addr1 instruction | Not available | 3 bytes |
| CALL !addr instruction | 3 machine cycles | Available |
| CALLF !faddr instruction | 2 machine cycles | 4 machine cycles |

Caution The Mk II mode supports a program area exceeding 16 Kbytes for the 75X and 75XL series. Therefore, this mode is effective for enhancing software compatibility with products exceeding 16 Kbytes.
When the Mk II mode is selected, the number of stack bytes used during execution of subroutine call instructions increases by one byte per stack compared to the Mk I mode. When the CALL !addr and CALLF !faddr instructions are used, the machine cycle becomes longer by one machine cycle. Therefore, use the Mk I mode if the RAM efficiency and processing performance are more important than software compatibility.

### 4.2 Setting Method of Stack Bank Select Register (SBS)

Switching between the Mk I mode and Mk II mode can be done by the stack bank select register (SBS). Figure 4-1 shows the format.

The SBS is set by a 4-bit memory manipulation instruction. When using the MkI mode, the SBS must be initialized to $10 \times X B^{\text {Note }}$ at the beginning of a program. When using the Mk II mode, it must be initialized to 00XXB ${ }^{\text {Note }}$.

Note Set the desired value in the XX positions.

Figure 4-1. Stack Bank Select Register Format

Caution Since SBS. 3 is set to " 1 " after a RESET signal is generated, the CPU operates in the Mk I mode. When executing an instruction in the Mk II mode, set SBS. 3 to " 0 " to select the Mk II mode.

## 5. MEMORY CONFIGURATION

- Program memory (ROM) ............... $12288 \times 8$ bits ( $\mu$ PD753012A)
............... $16384 \times 8$ bits ( $\mu$ PD753016A)
............... $24576 \times 8$ bits ( $\mu$ PD753017A)
Addresses 0000 H and 0001 H
Vector table wherein the program start address and the values set for the RBE and MBE at the time a $\overline{R E S E T}$ signal is generated are written. Reset start is possible from any address.
- Addresses 0002H to 000DH

Vector table wherein the program start address and the values set for the RBE and MBE by each vectored interrupt are written. Interrupt processing can start from any address.
Addresses 0020H to 007FH
Table area referenced by the GETI instruction ${ }^{\text {Note }}$.

Note The GETI instruction realizes a 1-byte instruction on behalf of any 2-byte/3-byte instruction, or two 1byte instructions. It is used to decrease the number of program steps.

- Data memory (RAM)
- Data area ... 1024 words $\times 4$ bits (000H to 3FFH)
- Peripheral hardware area... $128 \times 4$ bits (F80H to FFFH)

Figure 5-1. Program Memory Map (1/3)
(a) $\mu$ PD753012A

Note Can be used only in the Mk II mode.

Remark In addition to the above, a branch can be taken to the address indicated by changing only the low-order 8 bits of PC by executing the BR PCDE, BR PCXA instruction.

Figure 5-1. Program Memory Map (2/3)
(b) $\mu$ PD753016A

Note Can be used only in the Mk II mode.

Remark In addition to the above, a branch can be taken to the address indicated by changing only the low-order 8 bits of PC by executing the BR PCDE, BR PCXA instruction.

Figure 5-1. Program Memory Map (3/3)
(c) $\mu$ PD753017A

Note Can be used only in the Mk II mode.
Caution The interrupt vector start address shown above consists of 14 bits. Set it in 16 K space (0000H3FFFH).
Remark In addition to the above, a branch can be taken to the address indicated by changing only the low-order 8 bits of PC by executing the BR PCDE, BR PCXA instruction.

Figure 5-2. Data Memory Map

Note For stack area, one memory bank can be selected among memory banks 0 to 3 .

## 6. PERIPHERAL HARDWARE FUNCTIONS

### 6.1 Digital Input/Output Ports

There are four types of I/O ports as follows.

| . CMOS input (PORT0, 1) | $: 8$ |
| :--- | :---: |
| . CMOS input/output (PORT2, 3, 6, 7) | $: 16$ |
| • N-channel open-drain input/output (PORT4, 5) | $: 8$ |
| • Bit port output (BP0-BP7) | $: 8$ |
| Total | 40 |

Table 6-1. Types and Features of Digital Ports

| Port (Pin Name) | Function | Operation and Features |  | Remarks |
| :---: | :---: | :---: | :---: | :---: |
| PORTO (P00-P03) | 4-bit input | When the serial interface function is used, the alternate function pins function as output ports depending on the operation mode. |  | Also used for the INT4, SCK, SO/SB0, SI/SB1 pins. |
| PORT1 <br> (P10-P13) |  | Input-only port |  | Also used for the INTOINT2 and TIO-TI2 pins. |
| PORT2 <br> (P20-P23) | 4-bit I/O | Can be set to input mode or output mode in 4-bit units. |  | Also used for the PTOOPTO2, PCL, BUZ pins. |
| PORT3 (P30-P33) |  | Can be set to input mode or output mode in $1 / 4$-bit units. |  | Also used for the LCDCL, SYNC pins. |
| PORT4 <br> (P40-P43) | 4-bit I/O ( N -channel open-drain, 13 V withstanding) | Can be set to input mode or output mode in 4-bit units. | Ports 4 and 5 are paired and data can be input/ output in 8 -bit units. | On-chip pull-up resistor can be specified bit-wise by mask option. |
| PORT5 <br> (P50-P53) |  |  |  |  |
| PORT6 <br> (P60-P63) | 4-bit I/O | Can be set to input mode or output mode in $1 / 4$-bit units. | Ports 6 and 7 are paired and data can be input/ output in 8-bit units. | Also used for the KR0-KR3 pins. |
| PORT7 <br> (P70-P73) |  | Can be set to input mode or output mode in 4-bit units. |  | Also used for the KR4-KR7 pins. |
| BP0-BP7 | 1-bit output | Outputs data bit-wise. Can be switched to LCD drive segment output S24-S31 by software. |  | - |

### 6.2 Clock Generator

Operation of the clock generator is determined by the processor clock control register (PCC) and system clock control register (SCC).

The two clocks, the main system clock and subsystem clock, are available.
The instruction excution time can be altered.

- $0.95 \mu \mathrm{~s}, 1.91 \mu \mathrm{~s}, 3.81 \mu \mathrm{~s}, 15.3 \mu \mathrm{~s}$ (main system clock : at 4.19 MHz operation)
- $0.67 \mu \mathrm{~s}, 1.33 \mu \mathrm{~s}, 2.67 \mu \mathrm{~s}, 10.7 \mu \mathrm{~s}$ (main system clock : at 6.0 MHz operation)
- $122 \mu \mathrm{~s}$ (subsystem clock : at 32.768 kHz operation)

Figure 6-1. Clock Generator Block Diagram

Note Instruction execution

Remarks 1. $\mathrm{fx}_{\mathrm{x}}=$ Main system clock frequency
2. $\mathrm{f}_{\mathrm{XT}}=$ Subsystem clock frequency
3. $\Phi=$ CPU clock
4. PCC: Processor Clock Control Register
5. SCC: System Clock Control Register
6. One clock cycle (tcy) of $\Phi$ equal to one machine cycle of the instruction.

### 6.3 Subsystem Clock Oscillator Control Functions

The $\mu$ PD753017A subsystem clock oscillator has the following two control functions.

- Selects by software whether an internal feedback resistor is to be used or not ${ }^{\text {Note }}$.
- Reduces current consumption by decreasing the drive current of the on-chip inverter when the supply voltage is high ( $\mathrm{V}_{\mathrm{DD}} \geq 2.7 \mathrm{~V}$ ).

Note When the subsystem clock is not used, set SOS. 0 to 1 (so as not to use the internal feedback resistor) by software, connect XT1 to Vss, and open XT2. This makes it possible to reduce the current consumption in the subsystem clock oscillator.

The above functions can be used by switching the bits 0 and 1 of the sub-oscillator control register (SOS). (See Figure 6-2.)

Figure 6-2. Subsystem Clock Oscillator

### 6.4 Clock Output Circuit

The clock output circuit is provided to output the clock pulses from the P22/PTO2/PCL pin to the application of remote control wave outputs and peripheral LSI's.

- Clock output (PCL) : $\Phi, 524,262,65.5 \mathrm{kHz}$ (at 4.19 MHz operation)
$\Phi, 750,375,93.8 \mathrm{kHz}$ (at 6.0 MHz operation)

Figure 6-3. Clock Output Circuit Block Diagram

Remark Special care has been taken in designing the chip so that small-width pulses may not be output when switching clock output enable/disable.

### 6.5 Basic Interval Timer/Watchdog Timer

The basic interval timer/watchdog timer has the following functions.

- Interval timer operation to generate a reference time interrupt
- Watchdog timer operation to detect a runaway of program and reset the CPU
- Selects and counts the wait time when the standby mode is released
- Reads the contents of counting

Figure 6-4. Basic Interval Timer/Watchdog Timer Block Diagram

Note Instruction execution

### 6.6 Watch Timer

The $\mu$ PD753017A has one channel of watch timer. The watch timer has the following functions.

- Sets the test flag (IRQW) with 0.5 sec interval.

The standby mode can be released by the IRQW.

- 0.5 sec interval can be created by both the main system clock ( 4.19 MHz ) and subsystem clock ( 32.768 kHz ).
- Convenient for program debugging and checking as interval becomes 128 times longer ( 3.91 ms ) with the fast feed mode.
- Outputs the frequencies (2.048, 4.096, 32.768 kHz ) to the P23/BUZ pin, usable for buzzer and trimming of system clock oscillation frequencies.
- Clears the frequency divider to make the clock start with zero seconds.

Figure 6-5. Watch Timer Block Diagram

The values enclosed in parentheses are applied when $f x=4.19 \mathrm{MHz}$ and $\mathrm{fx}=32.768 \mathrm{kHz}$.

### 6.7 Timer/Event Counter

The $\mu$ PD753017A has three channels of timer/event counter. The timer/event counter has the following functions.

- Programmable interval timer operation
- Square wave output of any frequency to the PTOn pin ( $\mathrm{n}=0,1$ )
- Event counter operation
- Divides the frequency of signal input via the TIn pin to 1-Nth of the original signal and outputs the divided frequency to the PTOn pin (frequency division operation).
- Supplies the shift clock to the serial interface circuit (channel 0 only).
- Calls the count value.

The timer/event counter operates in the following four modes as set by the mode register.

Table 6-2. Operation Modes of Timer/Event Counter

| Mode | Channel |  |  |
| :--- | :---: | :---: | :---: |
| 8-bit timer/event counter mode |  |  |  |
|  | Gate control function | Nonote | No |
| PWM pulse generator mode | No | Yes |  |
| 16-bit timer/event counter mode |  |  |  |
|  | Gate control function | No Note | Yes |
| Carrier generator mode | No | Yes |  |

Note Used for gate control signal generation

Figure 6-7. Timer/Event Counter Block Diagram (Channel 1)

### 6.8 Serial Interface

The $\mu$ PD753017A is provided with an 8 -bit clocked serial interface. This serial interface operates in the following four modes:

- Operation stop mode
- 3-wire serial I/O mode
- 2-wire serial I/O mode
- SBI mode

## 6．9 LCD Controller／Driver

The $\mu$ PD753017A incorporates a display controller which generates segment and common signals according to the display data memory contents and incorporates segment and common drivers which can drive the LCD panel directly．

The $\mu$ PD753017A LCD controller／driver functions are as follows：
－Display data memory is read automatically by DMA operation and segment and common signals are generated．
－Display mode can be selected from among the following five：
〈1〉 Static
〈2〉 $1 / 2$ duty（time multiplexing by 2）， $1 / 2$ bias
〈3〉 $1 / 3$ duty（time multiplexing by 3 ）， $1 / 2$ bias
$\langle 4\rangle 1 / 3$ duty（time multiplexing by 3 ）， $1 / 3$ bias
$\langle 5\rangle 1 / 4$ duty（time multiplexing by 4 ）， $1 / 3$ bias
－A frame frequency can be selected from among four in each display mode．
－A maximum of 32 segment signal output pins（S0－S31）and four common signal output pins（COM0－COM3）．
－The segment signal output pins（S24－S27 and S28－S31）can be changed to the output ports in 4－pin units．
－Split－resistor can be incorporated to supply LCD drive power（mask option）．
－Various bias methods and LCD drive voltages can be applicable．
－When display is off，current flow to the split resistor is cut．
－Display data memory not used for display can be used for normal data memory．
－It can also operate by using the subsystem clock．

### 6.10 Bit Sequential Buffer ... 16 Bits

The bit sequential buffer ( BSB ) is a special data memory for bit manipulation and the bit manipulation can be easily performed by changing the address specification and bit specification in sequence, therefore it is useful when processing a long data bit-wise.

Figure 6-11. Bit Sequential Buffer Format

Remarks 1. In the pmem.@L addressing, the specified bit moves corresponding to the $L$ register.
2. In the pmem.@L addressing, the BSB can be manipulated regardless of MBE/MBS specification.

## 7. INTERRUPT FUNCTION AND TEST FUNCTION

$\mu$ PD753017A has eight types of interrupt sources and two types of test sources. Among the test sources, INT2
is provided with two testable inputs for edge detection.
$\mu$ PD753017A has the following functions in the interrupt control circuit.

## (1) Interrupt function

- Vectored interrupt function for hardware control, enabling/disabling the interrupt acceptance by the interrupt enable flag (IEXXX) and interrupt master enable flag (IME).
- Can set any interrupt start address.
- Nesting interrupts wherein the order of priority can be specified by the interrupt priority select register (IPS).
- Test function of interrupt request flag (IRQXXX). An interrupt generated can be checked by software.
- Release the standby mode. A release interrupt can be selected by the interrupt enable flag.
(2) Test function
- Test request flag (IRQXXX) generation can be checked by software.
- Release the standby mode. The test source to be released can be selected by the test enable flag.

Figure 7-1. Interrupt Control Circuit Block Diagram

Note Noise elimination circuit (Standby release is disabled when noise elimination circuit is selected.)

## 8. STANDBY FUNCTION

In order to save power consumption while a program is in a standby mode, two types of standby modes (STOP mode and HALT mode) are provided for the $\mu$ PD753017A.

Table 8-1. Operation Status in Standby Mode

|  |  |  | STOP Mode | HALT Mode |
| :---: | :---: | :---: | :---: | :---: |
|  | Set instruction |  | STOP instruction | HALT instruction |
|  | System clock when set |  | Settable only when the main system clock is used. | Settable both by the main system clock and subsystem clock. |
|  | Operation status | Clock generator | Only the main system clock stops oscillation. | Only the CPU clock $\Phi$ halts (oscillation continues). |
|  |  | Basic interval timer/ watchdog timer | Operation stops | Operation. (The IRQBT is set in the reference interval.) ${ }^{\text {Note } 1}$ |
|  |  | Serial interface | Operable only when an external $\overline{\text { SCK }}$ input is selected as the serial clock. | Operable ${ }^{\text {Note } 1}$ |
|  |  | Timer/event counter | Operable only when a signal input to the TIO-TI2 pins is specified as the count clock. | Operable ${ }^{\text {Note } 1}$ |
|  |  | Watch timer | Operable when $\mathrm{fxx}_{\mathrm{x}}$ is selected as the count clock. | Operable |
|  |  | LCD controller/driver | Operable only when $\mathrm{fxt}_{\mathrm{t}}$ is selected as the LCDCL. | Operable |
|  |  | External interrupt | The INT1, 2, and 4 are operable. Only the INTO is not operated. ${ }^{\text {Note } 2}$ |  |
|  |  | CPU | The operation stops. |  |
|  | Release signals |  | - Interrupt request signal sent from the operable hardware enabled by the interrupt enable flag. <br> - Test request signal sent from the test source enabled by the test enable flag. <br> - $\overline{\text { RESET }}$ input |  |

Notes 1. Cannot operate only when the main system clock stops.
2. Can operate only when the noise elimination circuit is not used $(\mathrm{IMO2}=1)$ by bit 2 of the edge detection mode register (IMO).

## 9. RESET FUNCTION

There are two reset inputs: external reset signal ( $\overline{\mathrm{RESET}}$ ) and reset signal sent from the basic interval timer/ watchdog timer. When either one of the reset signals are input, an internal reset signal is generated. Figure 91 shows the circuit diagram of the above two inputs.

Figure 9-1. Configuration of Reset Function

The $\mu$ PD753017A is set by the $\overline{\text { RESET }}$ signal generated and each hardware is initialized as listed in Table $9-1$. Figure $9-2$ shows the timing chart of the reset operation.

Figure 9-2. Reset Operation by $\overline{\text { RESET }}$ Signal Generation

Note The following two times can be selected by the mask option.
$2^{17} / \mathrm{fx}(21.8 \mathrm{~ms}$ : at 6.0 MHz operation, 31.3 ms : at 4.19 MHz operation)
$2^{15} / \mathrm{fx}(5.46 \mathrm{~ms}$ : at 6.0 MHz operation, 7.81 ms : at 4.19 MHz operation)

Table 9-1. Status of Each Hardware after Reset (1/2)

| Hardware |  |  | $\overline{\text { RESET Signal Generation }}$ in Standby Mode | $\overline{\text { RESET Signal Generation }}$ in Operation |
| :---: | :---: | :---: | :---: | :---: |
| Program counter (PC) |  |  | Sets the low-order 6 bits of program memory's address 0000H to the PC13-PC8 and the contents of address 0001 H to the PC7-PC0. Resets the PC14 of the $\mu$ PD753017A to 0 . | Sets the low-order 6 bits of program memory's address 0000 H to the PC13-PC8 and the contents of address 0001 H to the PC7-PC0. Resets the PC14 of the $\mu$ PD753017A to 0 . |

## 10. MASK OPTION

The $\mu$ PD753017A has the following mask options.

- P40-P43, P50-P53 mask options

On-chip pull-up resistors can be connected.
<1> On-chip pull-up resistors are specifiable bit-wise.
<2> On-chip pull-up resistors are not specifiable.

- Vlco-Vlcz pins, BIAS pin mask option

On-chip split resistor for LCD drive can be connected.
$<1>$ Split resistor is not connected.
<2> Four $10 \mathrm{k} \Omega$ (TYP.) split resistors are connected at the same time.
$<3>$ Four $100 \mathrm{k} \Omega$ (TYP.) split resistors are connected at the same time.

- Standby function mask option

Wait times can be selected by a RESET signal.
$<1>2^{17} / \mathrm{fx}(21.8 \mathrm{~ms}$ : at $\mathrm{fx}=6.0 \mathrm{MHz}, 31.3 \mathrm{~ms}$ : at $\mathrm{fx}=4.19 \mathrm{MHz})$
$<2>2^{15} / \mathrm{fx}(5.46 \mathrm{~ms}:$ at $\mathrm{fx}=6.0 \mathrm{MHz}, 7.81 \mathrm{~ms}:$ at $\mathrm{fx}=4.19 \mathrm{MHz})$

- Subsystem clock mask option

Use of the internal feedback resistor can be selected.
<1> Internal feedback resistor can be used.
(Switched ON/OFF via software)
<2> Internal feedback resistor cannot be used.
(Switched out in hardware)

## 11. INSTRUCTION SET

(1) Expression formats and description methods of operands

The operand is described in the operand column of each instruction in accordance with the description method for the operand expression format of the instruction. For details, refer to RA75X Assembler Package User's Manual_-Language (U12385E). If there are several elements, one of them is selected.
Capital letters and the + and - symbols are key words and are described as they are.
For immediate data, appropriate numbers and labels are described.
Instead of the labels such as mem, fmem, pmem, and bit, the symbols of the registers can be described. However, there are restrictions in the labels that can be described for fmem and pmem. For details, see User's Manual.

| Expression Format | Description Method |
| :---: | :---: |
| $\begin{aligned} & \text { reg } \\ & \text { reg1 } \end{aligned}$ | $\begin{aligned} & \text { X, A, B, C, D, E, H, L } \\ & \text { X, B, C, D, E, H, L } \end{aligned}$ |
| $\begin{aligned} & \text { rp } \\ & \text { rp1 } \\ & \text { rp2 } \\ & \text { rp' } \\ & \text { rp'1 } \end{aligned}$ | XA, BC, DE, HL <br> BC, DE, HL <br> BC, DE <br> XA, BC, DE, HL, XA', BC', DE', HL' <br> $B C, D E, H L, X A^{\prime}, B C^{\prime}, D E^{\prime}, H L^{\prime}$ |
| rpa <br> rpa1 | $\begin{aligned} & \mathrm{HL}, \mathrm{HL}+, \mathrm{HL}-, \mathrm{DE}, \mathrm{DL} \\ & \mathrm{DE}, \mathrm{DL} \end{aligned}$ |
| $\begin{aligned} & \text { n4 } \\ & \text { n8 } \end{aligned}$ | 4-bit immediate data or label <br> 8-bit immediate data or label |
| mem bit | 8 -bit immediate data or labe\|Note 2-bit immediate data or label |
| fmem pmem | FBOH-FBFH, FFOH-FFFH immediate data or label FCOH-FFFH immediate data or label |
| addr <br> addr1 <br> caddr <br> faddr | $0000 \mathrm{H}-2 \mathrm{FFFH}$ immediate data or label ( $\mu$ PD753012A) <br> 0000H-3FFFH immediate data or label ( $\mu$ PD753016A, 753017A) <br> $0000 \mathrm{H}-5 \mathrm{FFFH}$ immediate data or label <br> 12-bit immediate data or label <br> 11-bit immediate data or label |
| taddr | $20 \mathrm{H}-7 \mathrm{FH}$ immediate data (where bit0 $=0$ ) or label |
| PORTn <br> IEXXX <br> RBn <br> MBn | ```PORT0-PORT7 IEBT, IET0-IET2, IE0-IE2, IE4, IECSI, IEW RB0-RB3 MB0, MB1, MB2, MB3, MB15``` |

Note mem can be only used even address in 8-bit data processing.
(2) Legend in explanation of operation

| A | : A register; 4-bit accumulator |
| :--- | :--- |
| B | : B register |
| C | : C register |
| D | : D register |
| E | : E register |
| H | : H register |
| L | : L register |
| X | : X register |
| XA | : XA register pair; 8-bit accumulator |
| BC | : BC register pair |
| DE | : DE register pair |
| HL | : HL register pair |
| XA' | : XA' expanded register pair |
| BC' | : BC' expanded register pair |
| DE' | : DE' expanded register pair |
| HL' | : HL' expanded register pair |
| PC | : Program counter |
| SP | : Stack pointer |
| CY | : Carry flag; bit accumulator |
| PSW | : Program status word |
| MBE | : Memory bank enable flag |
| RBE | : Register bank enable flag |
| PORTn | : Port n (n = 0-7) |
| IME | : Interrupt master enable flag |
| IPS | : Interrupt priority selection register |
| IEXXX | : Interrupt enable flag |
| RBS | : Register bank selection register |
| MBS | : Memory bank selection register |
| PCC | : Processor clock control register |
| : Separation between address and bit |  |
| (XX) | : The contents addressed by XX |
| XXH | : Hexadecimal data |
|  |  |

(3) Explanation of symbols under addressing area column

Remarks 1. MB indicates memory bank that can be accessed.
2. In *2, MB $=0$ independently of how MBE and MBS are set.
3. In *4 and *5, MB = 15 independently of how MBE and MBS are set.
4. * 6 to *11 indicate the areas that can be addressed.
(4) Explanation of number of machine cycles column
$S$ denotes the number of machine cycles required by skip operation when a skip instruction is executed. The value of $S$ varies as follows.

- When no skip is made: $S=0$
- When the skipped instruction is a 1- or 2-byte instruction: $S=1$
- When the skipped instruction is a 3-byte instruction ${ }^{\text {Note }}: S=2$

Note 3-byte instruction: BR !addr, BRA !addr1, CALL !addr or CALLA !addr1 instruction

Caution The GETI instruction is skipped in one machine cycle.

One machine cycle is equal to one cycle of CPU clock $\Phi$ (= tcy); time can be selected from among four types by setting PCC.

| Instruction Group | Mnemonic | Operand | Number of Bytes | Number of Machine Cycles | Operation | Addressing Area | Skip Condition |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Transfer | MOV | A, \#n4 | 1 | 1 | $\mathrm{A} \leftarrow \mathrm{n} 4$ |  | String effect A |

Notes 1. While the IN instruction and OUT instruction are being executed, the MBE must be set to 0 or 1 and MBS must be set to 15 .
2. The above operations in the shaded boxes can be performed only in the Mk II mode. The other operations can be performed only in the Mk I mode.
3. The TBR and TCALL instructions are the table definition assembler pseudo instructions of the GETI instruction.

Remark When the $\mu$ PD753017A is set in the Mk I mode, $\mathrm{PC}_{14}$ is fixed to 0 .
12. ELECTRICAL SPECIFICATIONS

Absolute Maximum Ratings ( $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$ )

| Parameter | Symbol | Conditions |  | Ratings | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Supply voltage | VDD |  |  | -0.3 to +7.0 | V |
| Input voltage | $\mathrm{V}_{11}$ | Other than ports 4,5 |  | -0.3 to $V_{\text {DD }}+0.3$ | V |
|  | $\mathrm{V}_{12}$ | Ports | Pull-up resistor provided | -0.3 to VDD +0.3 | V |
|  |  | 4, 5 | N -ch open-drain | -0.3 to +14 | V |
| Output voltage | Vo |  |  | -0.3 to $V_{\text {DD }}+0.3$ | V |
| High-level output current | Іон | Per pin |  | -10 | mA |
|  |  | Total of all pins |  | -30 | mA |
| Low-level output current | IoL | Per pin |  | 30 | mA |
|  |  | Total of all pins |  | 220 | mA |
| Operating ambient temperature | $\mathrm{T}_{\mathrm{A}}$ |  |  | -40 to +85 | ${ }^{\circ} \mathrm{C}$ |
| Storage temperature | $\mathrm{T}_{\text {stg }}$ |  |  | -65 to +150 | ${ }^{\circ} \mathrm{C}$ |

Caution Product quality may suffer if the absolute maximum rating is exceeded even momentarily for any parameter. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions that ensure that the absolute maximum ratings are not exceeded.

Capacitance $\left(\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}, \mathrm{V}_{\mathrm{DD}}=0 \mathrm{~V}\right)$

| Parameter | Symbol | Conditions | MIN. | TYP. | MAX. | Unit |

| I/O capacitance | Cıo |  |  |  | 15 | pF |

Main System Clock Oscillator Characteristics $\left(T_{A}=-40\right.$ to $+85^{\circ} \mathrm{C}, \mathrm{V} D=1.8$ to 5.5 V$)$

| Resonator | Recommended Circuit | Parameter | Conditions | MIN. | TYP. | MAX. | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Ceramic resonator |  | Oscillation frequency <br> (fx) ${ }^{\text {Note }} 1$ |  | 1.0 |  | 6.0 ${ }^{\text {Note } 2}$ | MHz |
|  |  | Oscillation stabilization time ${ }^{\text {Note } 3}$ | After Vod has reached MIN. value of oscillation voltage range |  |  | 4 | ms |
| Crystal resonator |  | Oscillation frequency <br> (fx) ${ }^{\text {Note }} 1$ |  | 1.0 |  | $6.0^{\text {Note } 2}$ | MHz |
|  |  | Oscillation stabilization time ${ }^{\text {Note } 3}$ | $V_{D D}=4.5$ to 5.5 V |  |  | 10 | ms |
|  |  |  |  |  |  | 30 |  |
| External clock | $\mathrm{X}_{1} \quad \mathrm{X} 2$ | X1 input frequency $(f x)^{\text {Note }} 1$ |  | 1.0 |  | 6.0№te 2 | MHz |
|  |  | X1 input high-, low-level width (txh, txL) |  | 83.3 |  | 500 | ns |

Notes 1. The oscillation frequency and X 1 input frequency shown above indicate characteristics of the oscillator only. For the instruction execution time, refer to AC Characteristics.
2. If the oscillation frequency is $4.19 \mathrm{MHz}<\mathrm{fx} \leq 6.0 \mathrm{MHz}$ at $1.8 \mathrm{~V} \leq \mathrm{VDD}<2.7 \mathrm{~V}$, do not set the processor clock control register (PCC) to 0011. If $\mathrm{PCC}=0011$, one machine cycle time is less than $0.95 \mu \mathrm{~s}$, falling short of the rated value of $0.95 \mu \mathrm{~s}$.
3. The oscillation stabilization time is the time required for oscillation to be stabilized after VDD has been applied or STOP mode has been released.

Caution When using the main system clock oscillator, wire the portion enclosed in the dotted line in the above figure as follows to prevent adverse influence due to wiring capacitance:

- Keep the wiring length as short as possible.
- Do not cross the wiring with other signal lines.
- Do not route the wiring in the vicinity of a line through which a high alternating current flows.
- Always keep the ground point of the capacitor of the oscillator at the same potential as Vdd.
- Do not ground to a power supply pattern through which a high current flows.
- Do not extract signals from the oscillator.

|  | PBRC6.00B |  | - | - |  |  | On-chip capacitor |

Note When using the CSB1000J (1.0 MHz) by Murata Mfg. Co., Ltd. as a ceramic resonator, a limiting resistor $(R d=5.6 \mathrm{k} \Omega)$ is necessary (refer to the figure below). The resistor is not necessary when using the other recommended resonators.

Caution The oscillator constant and oscillation voltage range indicate conditions of stable oscillation. Oscillation frequency precision is not guaranteed. For applications requiring oscillation frequency precision, the oscillation frequency must be adjusted on the implementation circuit. For details, please contact directly the manufacturer of the resonator you will use.

Subsystem Clock Oscillator Characteristics ( $\mathrm{T}_{\mathrm{A}}=-40$ to $+85^{\circ} \mathrm{C}, \mathrm{VDD}=1.8$ to 5.5 V )

| Resonator | Recommended Circuit | Parameter | Conditions | MIN. | TYP. | MAX. | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Crystal resonator |  | Oscillation frequency $(\mathrm{fxt})^{\text {Note }} 1$ |  | 32 | 32.768 | 35 | kHz |
|  |  | Oscillation | $\mathrm{V}_{\mathrm{DD}}=4.5$ to 5.5 V |  | 1.0 | 2 | ms |
|  |  |  |  |  |  | 10 |  |
| External clock |  | XT1 input frequency $(\mathrm{fxT})^{\text {Note }} 1$ |  | 32 |  | 100 | kHz |
|  |  | XT1 input high-, low-level width (tхтн, tхть) |  | 5 |  | 15 | $\mu \mathrm{s}$ |

Notes 1. The oscillation frequency shown above indicates characteristics of the oscillator only. For the instruction execution time, refer to AC Characteristics.
2. The oscillation stabilization time is the time required for oscillation to be stabilized after Vod has been applied.

Caution When using the subsystem clock oscillator, wire the portion enclosed in the dotted line in the above figure as follows to prevent adverse influence due to wiring capacitance:

- Keep the wiring length as short as possible.
- Do not cross the wiring with other signal lines.
- Do not route the wiring in the vicinity of a line through which a high alternating current flows. - Always keep the ground point of the capacitor of the oscillator at the same potential as Vdd. - Do not ground to a power supply pattern through which a high current flows. - Do not extract signals from the oscillation circuit.

The subsystem clock oscillator has a low amplification factor to reduce current consumption and is more susceptible to noise than the main system clock oscillator. Therefore, exercise utmost care in wiring the subsystem clock oscillator.

Remark For the resonator selection and oscillator constant, customers are requested to either evaluate the oscillation themselves or apply to the resonator manufacturer for evaluation.

DC Characteristics ( $\mathrm{T}_{\mathrm{A}}=-40$ to $+85^{\circ} \mathrm{C}, \mathrm{V} D=1.8$ to 5.5 V )

Notes 1. When $1.8 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD}}<2.7 \mathrm{~V}, \mathrm{~T} A=-10$ to $+85^{\circ} \mathrm{C}$.
2. Clear VACO to 0 in the low current consumption mode and STOP mode. When VAC0 is set to 1 , the current increases by about $1 \mu \mathrm{~A}$.
3. Either Rlcd1 or Rlcd2 can be selected by mask option.
4. Voltage deviation is the difference between the ideal values (VLCDn; $n=0,1,2$ ) of the segment and common outputs and the output voltage.
5. The current flowing through the internal pull-up resistor and the LCD divider resistor is not included.
6. Including the case when the subsystem clock oscillates.
7. When the device operates in high-speed mode with the processor clock control register (PCC) set to 0011.
8. When the device operates in low-speed mode with PCC set to 0000.
9. When the device operates on the subsystem clock, with the system clock control register (SCC) set to 1001 and oscillation of the main system clock stopped.
10. When the sub-oscillator control register (SOS) is set to 0000.
11. When SOS is set to 0010 .
12. When SOS is set to 00X1, and the feedback resistor of the sub-oscillator is not used ( X : don't care).

AC Characteristics ( $\mathrm{T}_{\mathrm{A}}=-40$ to $+85^{\circ} \mathrm{C}, \mathrm{VDD}=1.8$ to 5.5 V )

| Parameter | Symbol | Conditions |  | MIN. | TYP. | MAX. | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| CPU clock cycle time ${ }^{\text {Note } 1}$ <br> (minimum instruction <br> execution time $=1$ <br> machine cycle) | tcy | Operates with | $\mathrm{V} D \mathrm{D}=2.7$ to 5.5 V | 0.67 |  | 64 | $\mu \mathrm{s}$ |
|  |  | main system clock |  | 0.95 |  | 64 | $\mu \mathrm{s}$ |
|  |  | Operates with subsystem clock |  | 114 | 122 | 125 | $\mu \mathrm{s}$ |

| $\overline{\text { RESET }}$ low-level width | trsL |  |  | 10 |  |  | $\mu \mathrm{s}$ |

Notes 1. The cycle time of the CPU clock ( $\Phi$ ) is determined by the oscillation frequency of the connected resonator, the system clock control register (SCC), and processor clock control register (PCC). The figure on the right shows the supply voltage VDD vs. cycle time tcy characteristics when the device operates with the main system clock.
2. 2 tcy or $128 / \mathrm{fx}$ depending on the setting of the interrupt mode register (IM0).

## Serial transfer operation

2-wire and 3-wire serial I/O modes ( $\overline{S C K} \cdots$ internal clock output): ( $\mathrm{T}_{\mathrm{A}}=-40$ to $+85^{\circ} \mathrm{C}, \mathrm{V}_{\mathrm{DD}}=1.8$ to 5.5 V )

## 15. RECOMMENDED SOLDERING CONDITIONS

Solder the $\mu$ PD753017A under the following recommended conditions.
For the details on the recommended soldering conditions, refer to Information Document Semiconductor Device Mounting Technology Manual (C10535E).

For the soldering methods and conditions other than those recommended, consult NEC.

Table 15-1. Soldering Conditions of Surface Mount Type (1/2)
(1) $\mu$ PD753012AGC-XXX-3B9: 80-pin plastic QFP ( $14 \times 14 \mathrm{~mm}$, resin thickness 2.7 mm ) $\mu$ PD753016AGC-XXX-3B9: 80-pin plastic QFP ( $14 \times 14 \mathrm{~mm}$, resin thickness 2.7 mm ) $\mu$ PD753017AGC-XXX-3B9: 80-pin plastic QFP ( $14 \times 14 \mathrm{~mm}$, resin thickness 2.7 mm )

| Soldering Method | Soldering Conditions | Symbol |
| :--- | :--- | :--- |
| Infrared reflow | Package peak temperature: $235^{\circ} \mathrm{C}$, Reflow time: 30 seconds or below <br> $\left(210^{\circ} \mathrm{C}\right.$ or higher), Number of reflow processes: 3 max. | IR35-00-3 |
| VPS | Package peak temperature: $215^{\circ} \mathrm{C}$, Reflow time: 40 seconds or below <br> $\left(200^{\circ} \mathrm{C}\right.$ or higher), Number of reflow processes: 3 max. | VP15-00-3 |

## APPENDIX B. DEVELOPMENT TOOLS

The following development tools are provided for system development using the $\mu$ PD753017A. The 75XL series uses a common relocatable assembler, in combination with a device file matching each machine.

## Language processor

| RA75X relocatable assembler | Host Machine |  |  | Part Number (product name) |
| :---: | :---: | :---: | :---: | :---: |
|  |  | OS | Supply media |  |
|  | PC-9800 series | MS-DOS ${ }^{\text {M }}$ | 3.5-inch 2HD | $\mu$ S5A13RA75X |
|  |  | $\binom{\text { Ver. } 3.30 \text { to }}{\text { Ver. } 6.2^{\text {Note }}}$ |  |  |
|  | IBM PC/AT ${ }^{T M}$ and compatible machines | Refer to OS for IBM PC | 3.5-inch 2 HC | $\mu$ S7B13RA75X |

| Device file | Host Machine |  |  | Part Number (product name) |
| :---: | :---: | :---: | :---: | :---: |
|  |  | OS | Supply media |  |
|  | PC-9800 series | MS-DOS | 3.5-inch 2HD | $\mu$ S5A13DF753017 |
|  |  | $\binom{\text { Ver. } 3.30 \text { to }}{\text { Ver. } 6.2^{\text {Note }}}$ |  |  |
|  | IBM PC/AT and compatible machines | Refer to OS for IBM PC | 3.5-inch 2 HC | $\mu$ S7B13DF753017 |

Note Ver. 5.00 or later is provided with a task swap function, but it does not work with this software.

Remark The operation of the assembler and device file is guaranteed only on the above host machines and OSs.

## PROM write tools

| Hardware | PG-1500 | PG-1500 is a PROM programmer which enables you to program single-chip microcontroller containing PROM by stand-alone or host machine operation by connecting an attached board and optional programmer adapter to PG-1500. <br> It also enables you to program typical PROM devices of 256 K bits to 4 M bits. |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | PA-75P316BGC | PROM programmer adapter common to $\mu$ PD75P3018GC-3B9. Connect the programmer adapter to PG-1500 for use. |  |  |  |
|  | PA-75P316BGK | PROM programmer adapter common to $\mu$ PD75P3018GK-BE9. Connect the programmer adapter to PG-1500 for use. |  |  |  |
|  | PA-75P3018AGC-8BT | PROM programmer adapter common to $\mu$ PD75P3018AGC-8BT. Connect the programmer adapter to PG-1500 for use. |  |  |  |
|  | PA-75P3018AGK-9EU | PROM programmer adapter common to $\mu$ PD75P3018AGK-9EU. Connect the programmer adapter to PG-1500 for use. |  |  |  |
| Software | PG-1500 controller | PG-1500 and a host machine are connected by serial and parallel interfaces and PG-1500 is controlled on the host machine. |  |  |  |
|  |  | Host machine | OS | Supply media | Part number (product name) |
|  |  | PC-9800 series | $\begin{gathered} \text { MS-DOS } \\ \binom{\text { Ver. } 3.30 \text { to }}{\text { Ver. } 6.2^{\text {Note }}} \end{gathered}$ | 3.5 -inch 2HD | $\mu$ S5A13PG1500 |
|  |  | IBM PC/AT and compatible machines | Refer to OS for IBM PC | 3.5-inch 2HD | $\mu$ S7B13PG1500 |

Note Ver. 5.00 or later is provided with a task swap function, but it does not work with this software.

Remark The operation of the PG-1500 controller is guaranteed only on the above host machines and OSs.

## Debugging tool

The in-circuit emulators (IE-75000-R and IE-75001-R) are available as the program debugging tool for the $\mu$ PD753017A.

The system configurations are described as follows.

| Hardware | IE-75000-R ${ }^{\text {Note } 1}$ | In-circuit emulator for debugging the hardware and software when developing the application systems that use the 75 X series and 75 XL series. When developing a $\mu$ PD753017 subseries, the emulation board IE-75300-R-EM and emulation probe that are sold separately must be used with the IE-75000-R. <br> By connecting with the host machine and the PROM programmer, efficient debugging can be made. <br> It contains the emulation board IE-75000-R-EM which is connected. |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | IE-75001-R | In-circuit emulator for debugging the hardware and software when developing the application systems that use the 75X series and 75XL series. When developing a $\mu$ PD753017 subseries, the emulation board IE-75300-R-EM and emulation probe which are sold separately must be used with the IE-75001-R. <br> It can debug the system efficiently by connecting the host machine and PROM programmer. |  |  |  |
|  | IE-75300-R-EM | Emulation board for evaluating the application systems that use the $\mu$ PD753017 subseries. It must be used with the IE-75000-R or IE-75001-R. |  |  |  |
|  | EP-753017GC-R <br> EV-9200GC-80 | Emulation probe for the $\mu$ PD753017AGC. <br> It must be connected to the IE-75000-R (or IE-75001-R) and IE-75300-R-EM. <br> It is supplied with the 80 -pin conversion socket EV-9200GC-80 which facilitates connection to a target system. |  |  |  |
|  | EP-753017GK-R <br> TGK-080SDW ${ }^{\text {Note } 2}$ | Emulation probe for the $\mu$ PD753017AGK. <br> It must be connected to the IE-75000-R (or IE-75001-R) and IE-75300-R-EM. <br> It is supplied with the 80 -pin conversion adapter TGK-080SDW which facilitates connection to a target system. |  |  |  |
| Software | IE control program | Connects the IE-75000-R or IE-75001-R to a host machine via RS-232-C and Centronix I/F and controls the IE-75000-R or IE-75001-R on a host machine. |  |  |  |
|  |  | Host machine | OS | Supply media | Part number (product name) |
|  |  | PC-9800 series | MS-DOS | 3.5-inch 2HD | $\mu$ S5A13IE75X |
|  |  |  | $\binom{\text { Ver. } 3.30 \text { to }}{\text { Ver. } 6.2^{\text {Note } 3}}$ | 5-inch 2HD | $\mu$ S5A10IE75X |
|  |  | IBM PC/AT and compatible machines | Refer to OS for IBM PC | 3.5-inch 2HC | $\mu$ S7B13IE75X |
|  |  |  |  | 5-inch 2 HC | $\mu$ S7B10IE75X |

Notes 1. Maintenance parts
2. This is a product of TOKYO ELETECH CORPORATION.

For further information, contact: Daimaru Kogyo, Ltd.
Tokyo Electronics Department (TEL +81-3-3820-7112)
Osaka Electronics 2nd Department (TEL +81-6-6244-6672)
3. Ver.5.00 or later is provided with a task swap function, but it dose not work with this software.

Remarks 1. The operation of the IE control program is guaranteed only on the above host machines and OSs.
2. The $\mu$ PD753012, 753016, 753017, 75P3018, 753012A, 753016A, 753017A, and 75P3018A are commonly referred to as the $\mu$ PD753017 subseries.

## NEC

## OS for IBM PC

The following IBM PC OS's are supported.

| OS | Version |
| :---: | :---: |
| PC DOS ${ }^{\text {TM }}$ | Ver. 5.02 to Ver. 6.3 J6.1/V ${ }^{\text {Note }}$ to $\mathrm{J} 6.3 / V^{\text {Note }}$ |
| MS-DOS | Ver. 5.0 to Ver. 6.22 5.0/V $V^{\text {Note }}$ to $6.2 / V^{\text {Note }}$ |
| IBM DOS ${ }^{\text {TM }}$ | J5.02/V ${ }^{\text {Note }}$ |

Note Only English version is supported.

Caution Ver. 5.0 or later is provided with a task swap function, but it does not work with this software.

## APPENDIX C. RELATED DOCUMENTS

The related documents indicated in this publication may include preliminary versions. However, preliminary versions are not marked as such.

## NOTES FOR CMOS DEVICES

## (1) PRECAUTION AGAINST ESD FOR SEMICONDUCTORS

Note:
Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

## (2) HANDLING OF UNUSED INPUT PINS FOR CMOS

Note:
No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to VDD or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

## (3) STATUS BEFORE INITIALIZATION OF MOS DEVICES

Note:
Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

## Regional Information

Some information contained in this document may vary from country to country. Before using any NEC product in your application, please contact the NEC office in your country to obtain a list of authorized representatives and distributors. They will verify:

- Device availability
- Ordering information
- Product release schedule
- Availability of related technical literature
- Development environment specifications (for example, specifications for third-party tools and components, host computers, power plugs, AC supply voltages, and so forth)
- Network requirements

In addition, trademarks, registered trademarks, export restrictions, and other legal issues may also vary from country to country.

## MS-DOS is either a registered trademark or a trademark of Microsoft Corporation in the United States

 and/or other countries.IBM DOS, PC/AT, and PC DOS are trademarks of International Business Machines Corporation.
The export of this product from Japan is regulated by the Japanese government. To export this product may be prohibited without governmental license, the need for which must be judged by the customer. The export or re-export of this product from a country other than Japan may also be prohibited without a license from that country. Please call an NEC sales representative.

- The information in this document is current as of April, 2000. The information is subject to change without notice. For actual design-in, refer to the latest publications of NEC's data sheets or data books, etc., for the most up-to-date specifications of NEC semiconductor products. Not all products and/or types are available in every country. Please check with an NEC sales representative for availability and additional information.
- No part of this document may be copied or reproduced in any form or by any means without prior written consent of NEC. NEC assumes no responsibility for any errors that may appear in this document.
- NEC does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from the use of NEC semiconductor products listed in this document or any other liability arising from the use of such products. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC or others.
- Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of customer's equipment shall be done under the full responsibility of customer. NEC assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.
- While NEC endeavours to enhance the quality, reliability and safety of NEC semiconductor products, customers agree and acknowledge that the possibility of defects thereof cannot be eliminated entirely. To minimize risks of damage to property or injury (including death) to persons arising from defects in NEC semiconductor products, customers must incorporate sufficient safety measures in their design, such as redundancy, fire-containment, and anti-failure features.
- NEC semiconductor products are classified into the following three quality grades:
"Standard", "Special" and "Specific". The "Specific" quality grade applies only to semiconductor products developed based on a customer-designated "quality assurance program" for a specific application. The recommended applications of a semiconductor product depend on its quality grade, as indicated below. Customers must check the quality grade of each semiconductor product before using it in a particular application.
"Standard": Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots
"Special": Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)
"Specific": Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems and medical equipment for life support, etc.
The quality grade of NEC semiconductor products is "Standard" unless otherwise expressly specified in NEC's data sheets or data books, etc. If customers wish to use NEC semiconductor products in applications not intended by NEC, they must contact an NEC sales representative in advance to determine NEC's willingness to support a given application.
(Note)
(1) "NEC" as used in this statement means NEC Corporation and also includes its majority-owned subsidiaries.
(2) "NEC semiconductor products" means any semiconductor product developed or manufactured by or for NEC (as defined above).

[^0]:    Caution Do not use two or more soldering methods in combination (except the partial heating method).
