

# $\mu$ PD78F9116B, 78F9116B(A)

## 8-BIT SINGLE-CHIP MICROCONTROLLERS

### DESCRIPTION

The  $\mu$ PD78F9116B is a  $\mu$ PD789114A Subseries product of the 78K/0S Series.

The  $\mu$ PD78F9116B replaces the internal ROM of the  $\mu$ PD789111A, 789112A and 789114A with flash memory, which enables the writing/erasing of a program while the device is mounted on the board.

A stricter quality assurance program (called special grade in NEC's grade classification) is applied to the  $\mu$ PD78F9116B(A), compared to the  $\mu$ PD78F9116B, which are classified as standard grade.

Because flash memory allows the program to be written and erased electrically with the device mounted on the board, this product is ideal for the evaluation stages of system development, small-scale production, and rapid development of new products.

Detailed function descriptions are provided in the following user's manuals. Be sure to read them before designing.

$\mu$ PD789104A, 789114A, 789124A, 789134A Subseries User's Manual: U14643E

78K/0S Series User's Manual Instruction: U11047E

### FEATURES

- Pin-compatible with mask ROM version (excluding  $V_{PP}$  pin)
- Flash memory: 16 KB
- Internal high-speed RAM: 256 bytes
- On-chip multiplier: 8 bits  $\times$  8 bits = 16 bits
- Minimum instruction execution time can be changed from high-speed (0.2  $\mu$ s) to low-speed (0.8  $\mu$ s) (@ 10.0 MHz operation with system clock,  $V_{DD}$  = 4.5 to 5.5 V)
- I/O ports: 20
- Serial interface: 1 channel: Switchable between 3-wire serial I/O and UART modes
- 10-bit resolution A/D converter: 4 channels
- Timers: 3 channels
  - 16-bit timer: 1 channel
  - 8-bit timer/event counter: 1 channel
  - Watchdog timer: 1 channel
- Power supply voltage:  $V_{DD}$  = 1.8 to 5.5 V

### APPLICATIONS

Cleaners, washing machines, refrigerators and battery-charger

## 78K/0S SERIES LINEUP

The products in the 78K/0S Series are listed below. The names enclosed in boxes are subseries names.

**Remark** VFD (Vacuum Fluorescent Display) is referred to as FIP™ (Fluorescent Indicator Panel) in some documents, but the functions of the two are the same.

The major functional differences among the subseries are listed below.

## 6. FLASH MEMORY CHARACTERISTICS

Flash memory programming is performed by connecting a dedicated flash programmer (Flashpro III (part no. FL-PR3, PG-FP3)/Flashpro IV<sup>Note</sup> (part no. FL-PR4, PG-FP4)) to the target system with the flash memory mounted on the target system (on-board). A flash memory writing adapter (program adapter), which is a target board used exclusively for programming, is also provided.

**Note** Under development

**Remark** FL-PR3, FL-PR4, and the program adapter are the products made by Naito Densai Machida Mfg. Co., Ltd. (TEL +81-45-475-4191).

Programming using flash memory has the following advantages.

- Software can be modified after the microcontroller is solder-mounted on the target system.
- Distinguishing software facilities low-quantity, varied model production
- Easy data adjustment when starting mass production

### 6.1 Programming Environment

The following shows the environment required for  $\mu$ PD78F9116B and 78F9116B(A) flash memory programming.

When Flashpro III (part no. FL-PR3, PG-FP3) or Flashpro IV (Part no. FL-PR4, PG-FP4) is used as a dedicated flash programmer, a host machine is required to control the dedicated flash programmer. Communication between the host machine and flash programmer is performed via RS-232C/USB (Rev. 1.1).

For details, refer the manuals for Flashpro III/Flashpro IV.

**Remark** USB is supported by Flashpro IV only.

**Figure 6-1. Environment for Writing Program to Flash Memory**

## 6.2 Communication Mode

Use the communication mode shown in Table 6-1 to perform communication between the dedicated flash programmer and the μPD78F9116B or 78F9116B(A).

**Table 6-1. Communication Mode List**

Communication Mode	TYPE Setting <sup>Note 1</sup>					Pins used	Number of V <sub>PP</sub> pulses
	COMM PORT	SIO clock	CPU clock	Flash clock	Multiple rate		
3-wire serial I/O (SIO3)	SIO ch-0 (3-wire, sync.)	100 Hz to 1.25 MHz <sup>Note 2</sup>	Optional	1 to 10 MHz <sup>Note 2</sup>	1.0	SCK20/ASCK20/P20 SO20/TxD20/P21 SI20/RxD20/P22	0
	SIO ch-1 (3-wire, sync.)					P00 P01 P02	1
UART (UART0)	UART ch-0	4800 to 76800 bps <sup>Note 2, 3</sup>	Optional	1 to 10 MHz <sup>Note 2</sup>		TxD20/SO20/P21 RxD20/SI20/P22	8

- Notes**
1. Selection items for TYPE settings on the dedicated flash programmer (Flashpro III (part no. FL-PR3, PG-FP3)/Flashpro IV (Part no. FL-PR4, PG-FP4)).
  2. The possible setting range differs depending on the voltage. For details, refer to **8. ELECTRICAL SPECIFICATIONS**.

**Caution** Be sure to select a communication mode depending on the number of V<sub>PP</sub> pulses shown in Table 6-1.

**Figure 6-2. Communication Mode Selection Format**

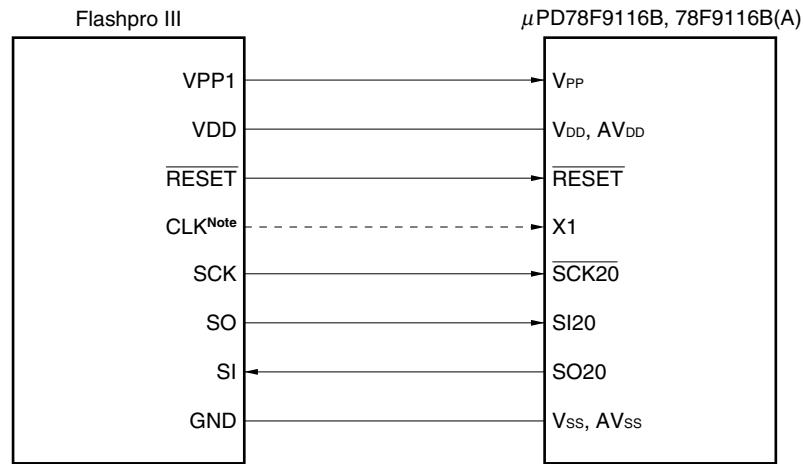

Figure 6-3. Example of Connection with Dedicated Flash Programmer

## (a) 3-Wired Serial I/O Mode (SIO ch-0)

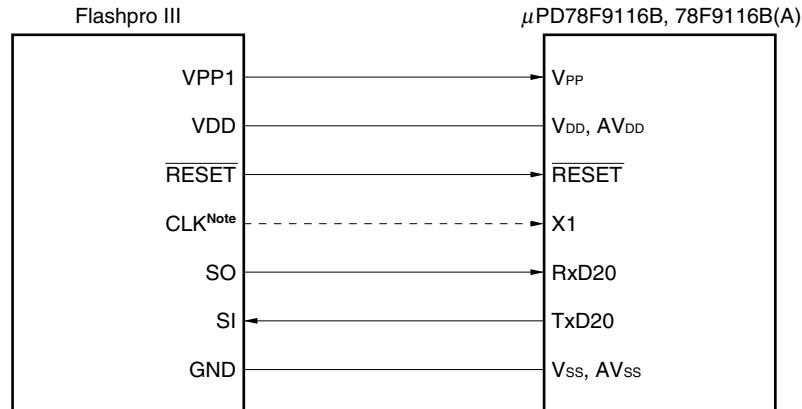

## (b) 3-Wired Serial I/O Mode (SIO ch-1)

**Note** Connect this pin when the system clock is supplied by Flashpro III. When a resonator has already been connected to the X1 pin, the CLK pin does not need to be connected.

**Caution** The V<sub>DD</sub> pin, if already connected to the power supply, must be connected to the VDD pin of the dedicated flash programmer. Before using the power supply connected to the V<sub>DD</sub> pin, supply voltage before starting programming.

(c) UART Mode

**Note** Connect this pin when the system clock is supplied by Flashpro III. When a resonator has already been connected to the X1 pin, the CLK pin does not need to be connected.

**Caution** The V<sub>DD</sub> pin, if already connected to the power supply, must be connected to the VDD pin of the dedicated flash programmer. Before using the power supply connected to the V<sub>DD</sub> pin, supply voltage before starting programming.

If Flashpro III (part no. FL-PR3, PG-FP3)/Flashpro IV is used as a dedicated flash programmer, the following signals are generated for the μPD78F9116B and 78F9116B(A). For details, refer to the manual of Flashpro III/Flashpro IV.

Table 6-2. Pin Connection List

Signal Name	I/O	Pin Function	Pin Name	3-Wire Serial I/O	UART
VPP1	Output	Write voltage	V <sub>PP</sub>	⊙	⊙
VPP2	—	—	—	×	×
VDD	I/O	V <sub>DD</sub> voltage generation/voltage monitoring	V <sub>DD</sub> /AV <sub>DD</sub>	⊙ <sup>Note</sup>	⊙ <sup>Note</sup>
GND	—	Ground	V <sub>SS</sub> /AV <sub>SS</sub>	⊙	⊙
CLK	Output	Clock output	X1	○	○
RESET	Output	Reset signal	RESET	⊙	⊙
SI	Input	Reception signal	SO20/P01/TxD20	⊙	⊙
SO	Output	Transmit signal	SI20/P02/RxD20	⊙	⊙
SCK	Output	Transfer clock	SCK20/P00	⊙	×
HS	—	—	—	×	×

**Note** V<sub>DD</sub> voltage must be supplied before programming is started.

**Remark** ⊙: Pin must be connected.

○: If the signal is supplied on the target board, pin need not be connected.

×: Pin need not be connected.

6.3 On-Board Pin Processing

When performing programming on the target system, provide a connector on the target system to connect the dedicated flash programmer.

An on-board function that allows switching between normal operation mode and flash memory programming mode may be required in some cases.

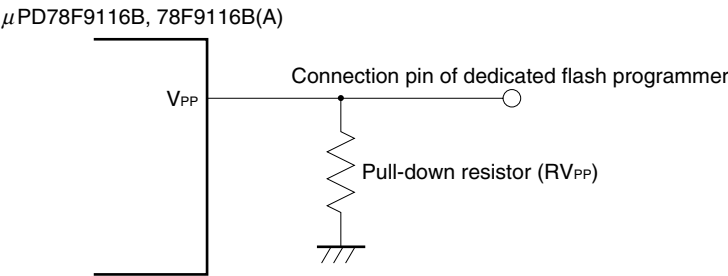

<V<sub>PP</sub> pin>

In normal operation mode, input 0 V to the V<sub>PP</sub> pin. In flash memory programming mode, a write voltage of 10.0 V (TYP.) is supplied to the V<sub>PP</sub> pin, so perform the following.

- (1) Connect a pull-down resistor (RV<sub>PP</sub> = 10 kΩ) to the V<sub>PP</sub> pin.
- (2) Use the jumper on the board to switch the V<sub>PP</sub> pin input to either the writer or directly to GND.

A V<sub>PP</sub> pin connection example is shown below.

Figure 6-4. V<sub>PP</sub> Pin Connection Example

<Serial interface pin>

The following shows the pins used by the serial interface.

Serial Interface	Pins Used
3-wire serial I/O (SIO3)	SCK20, SO20, SI20
	P00, P01, P02
UART	TxD20, RxD20

When connecting the dedicated flash programmer a serial interface pin that is connected to another device on-board, signal conflict or abnormal operation of the other devices may occur. Care must therefore be taken with such connections.

### (1) Signal conflict

If the dedicated flash programmer (output) is connected to a serial interface pin (input) that is connected to another device (output), a signal conflict occurs. To prevent this, isolate the connection with the other device or set the other device to the output high impedance status.

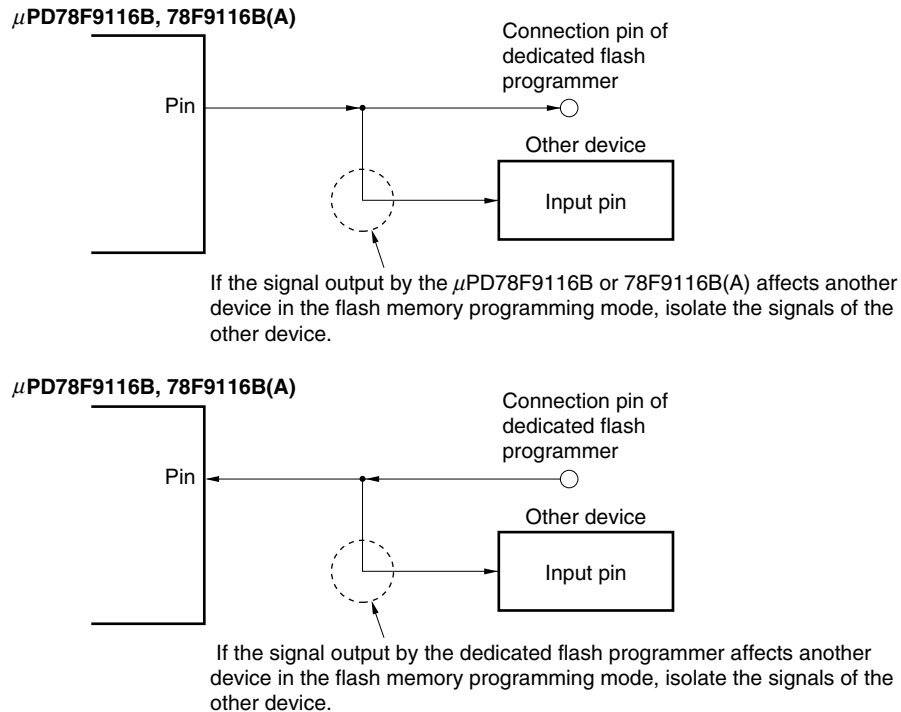

**Figure 6-5. Signal Conflict (Input Pin of Serial Interface)**

### (2) Abnormal operation of other device

If the dedicated flash programmer (output or input) is connected to a serial interface pin (input or output) that is connected to another device (input), a signal is output to the device, and this may cause an abnormal operation. To prevent this abnormal operation, isolate the connection with the other device or set so that the input signals to the other device are ignored.

**Figure 6-6. Abnormal Operation of Other Device**

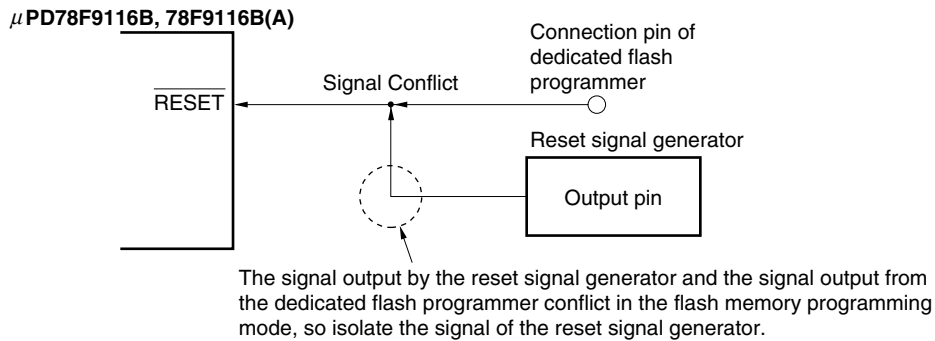

<RESET pin>

If the reset signal of the dedicated flash programmer is connected to the  $\overline{\text{RESET}}$  pin connected to the reset signal generator on-board, a signal conflict occurs. To prevent this, isolate the connection with the reset signal generator.

If the reset signal is input from the user system in the flash memory programming mode, a normal programming operation cannot be performed. Therefore, do not input reset signals from other than the dedicated flash programmer.

Figure 6-7. Signal Conflict ( $\overline{\text{RESET}}$  Pin)

<Port pins>

When the μPD78F9116B or 78F9116B(A) enters the flash memory programming mode, all the pins other than those that communicate in flash memory programming are in the same status as immediately after reset.

If the external device does not recognize initial statuses such as the output high impedance status, therefore, connect the external device to  $V_{DD}$  or  $V_{SS}$ .

<Oscillation pins>

When using the on-board clock, connect X1 and X2 as required in the normal operation mode.

When using the clock output of the flash programmer, connect it directly to X1, disconnecting the main resonator on-board, and leave the X2 pin open.

<Power supply>

When using the power supply output of the flash programmer, connect the  $V_{DD}$  and  $V_{SS}$  pins to VDD and GND of the flash programmer, respectively.

When using the on-board power supply, connect it as required in the normal operation mode. Because the flash programmer monitors the voltage, however, VDD of the flash programmer must be connected.

For the other power pins ( $AV_{DD}$  and  $A_{SS}$ ), supply the same power supply as in the normal operation mode.

#### 6.4 Connection When Using Flash Memory Writing Adapter

The following shows an example of the recommended connection when using the flash memory writing adapter.

**Figure 6-8. Example of Flash Memory Writing Adapter Connection When Using 3-Wire Serial I/O Mode (SIO-ch0)**

## 7. INSTRUCTION SET OVERVIEW

This section shows a list of the instruction set for the μPD78F9116B and 78F9116B(A).

### 7.1 Conventions

#### 7.1.1 Operand identifiers and description methods

Operands are described in the “Operand” column of each instruction in accordance with the description method of the instruction operand identifier (refer to the assembler specifications for detail). When there are two or more description methods, select one of them. Alphabetic letters in capitals and the symbols, #, !, \$, and [ ], are keywords and must be described as they are. Each symbol has the following meaning.

- #: Immediate data specification
- \$: Relative address specification
- !: Absolute address specification
- [ ]: Indirect address specification

In the case of immediate data, describe an appropriate numeric value or a label. When using a label, be sure to describe the #, !, \$, or [ ] symbols.

For operand register identifiers, r and rp, either function names (X, A, C, etc.) or absolute names (names in parentheses in the table below, R0, R1, R2, etc.) can be used for description.

**Table 7-1. Operand Identifiers and Description Methods**

Identifier	Description Method
r rp sfr	X (R0), A (R1), C (R2), B (R3), E (R4), D (R5), L (R6), H (R7), AX (RP0), BC (RP1), DE (RP2), HL (RP3) Special function register symbol
saddr saddrp	FE20H to FF1FH immediate data or label FE20H to FF1FH immediate data or label (even address only)
addr16 addr5	0000H to FFFFH immediate data or label (Only even addresses for 16-bit data transfer instructions) 0040H to 007FH immediate data or label (even address only)
word byte bit	16-bit immediate data or label 8-bit immediate data or label 3-bit immediate data or label

**7.1.2 Descriptions of the operation field**

A:	A register; 8-bit accumulator
X:	X register
B:	B register
C:	C register
D:	D register
E:	E register
H:	H register
L:	L register
AX:	AX register pair; 16-bit accumulator
BC:	BC register pair
DE:	DE register pair
HL:	HL register pair
PC:	Program counter
SP:	Stack pointer
PSW:	Program status word
CY:	Carry flag
AC:	Auxiliary carry flag
Z:	Zero flag
IE:	Interrupt request enable flag
NMIS:	Non-maskable interrupt servicing flag
( ):	Memory contents indicated by address or register contents in parentheses
X <sub>H</sub> , X <sub>L</sub> :	Higher 8 bits and lower 8 bits of 16-bit register
^:	Logical product (AND)
∨:	Logical sum (OR)
⊕:	Exclusive OR
— :	Inverted data
addr16:	16-bit immediate data or label
jdsp8:	Signed 8-bit data (displacement value)

**7.1.3 Description of the flag operation field**

(Blank):	Not affected
0:	Cleared to 0
1:	Set to 1
×:	Set/cleared according to the result
R:	Previously saved value is restored

**Caution** Product quality may suffer if the absolute maximum rating is exceeded even momentarily for any parameter. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions that ensure that the absolute maximum ratings are not exceeded.

**Remark** Unless specified otherwise, the characteristics of alternate-function pins are the same as those of port pins.

- Notes**
1. Indicates only oscillator characteristics. Refer to **AC characteristics** for instruction execution time.
  2. Time required to stabilize oscillation after a reset or STOP mode release. Use the resonator that stabilizes oscillation during the oscillation wait time.

**Caution** When using the system clock oscillator, wire as follows in the area enclosed by the broken lines in the above figures to avoid an adverse effect from wiring capacitance.

- Keep the wiring length as short as possible.
- Do not cross the wiring with the other signal lines.
- Do not route the wiring near a signal line through which a high fluctuating current flows.
- Always make the ground point of the oscillator capacitor the same potential as V<sub>SS</sub>.
- Do not ground the capacitor to a ground pattern through which a high current flows.
- Do not fetch signals from the oscillator.

**Remark** For the resonator selection and oscillator constant, customers are requested to either evaluate the oscillation themselves or apply to the resonator manufacturer for evaluation.

- Notes**
1. When port 5 is in input mode, a low-level input leakage current of −60 μA (MAX.) flows only for 1 cycle time after a read instruction has been executed to port 5.
  2. The current flowing to the ports (including the current flowing through an on-chip pull-up resistor) and AV<sub>DD</sub> current are not included.
  3. The current flowing to the ports (including the current flowing through an on-chip pull-up resistor) is not included.
  4. High-speed mode operation (when processor clock control register (PCC) is set to 00H.)
  5. Low-speed mode operation (when PCC is set to 02H).

## 10. RECOMMENDED SOLDERING CONDITIONS

The μPD78F9116B and 78F9116B(A) should be soldered and mounted under the following recommended conditions.

For the details of the recommended soldering conditions, refer to the document **Semiconductor Device Mounting Technology Manual (C10535E)**. For soldering methods and conditions other than those recommended below, contact your NEC sales representative.

**Table 10-1. Surface Mounting Type Soldering Conditions**

μPD78F9116BMC-5A4: 30-pin plastic SSOP (7.62 mm (300))

μPD78F9116BMC(A)-5A4: 30-pin plastic SSOP (7.62 mm (300))

**Note** After opening the dry pack, store it at 25°C or less and 65% RH or less for the allowable storage period.

**Caution** Do not use different soldering methods together (except for partial heating).

## APPENDIX A. DEVELOPMENT TOOLS

The following development tools are available for system development using the μPD78F9116B and 78F9116B(A).

### Software package

SP78K0S <sup>Notes 1, 2</sup>	CD-ROM in which the development tools (software) common to the 78K/0S Series are included as a package
-------------------------------	--

### Language Processing Software

RA78K0S <sup>Notes 1, 2, 3</sup>	Assembler package common to 78K/0S Series
CC78K0S <sup>Notes 1, 2, 3</sup>	C compiler package common to 78K/0S Series
DF789136 <sup>Notes 1, 2, 3</sup>	Device file for μPD78F9116B

### Flash Memory Writing Tools

Flashpro III (Model number: FL-PR3 <sup>Note 4</sup> , PG-FP3)	Dedicated flash programmer for on-chip flash memory
FA-30MC <sup>Note 4</sup>	Flash memory writing adapter

### Debugging Tools (1/2)

IE-78K0S-NS In-circuit emulator	In-circuit emulator serves to debug hardware and software when developing application systems using a 78K/0S Series product. It supports the ID78K0S-NS integrated debugger. Used in combination with an AC adapter, emulation probe, and interface adapter connecting to the host machine.
IE-78K0S-NS-A In-circuit emulator	The IE-78K0S-NS-A provides a coverage function in addition to the IE-78K0S-NS functions, thus enhancing the debug functions, including the tracer and timer functions.
IE-70000-MC-PS-B AC adapter	Adapter used to supply power from a power outlet of 100 V AC to 240 V AC.
IE-70000-98-IF-C Interface adapter	Adapter when PC-9800 series PC (except notebook type) is used as the host machine (C bus supported).
IE-70000-CD-IF-A PC card interface	PC card and interface cable when notebook PC is used as the host machine (PCMCIA socket supported).
IE-70000-PC-IF-C Interface adapter	Adapter when using an IBM PC/AT™ or compatible as the host machine.
IE-70000-PCI-IF-A Interface adapter	Adapter when using PC that includes a PCI bus as the IE-78K0S-NS host machine.
IE-789136-NS-EM1 Emulation board	Board for emulation of the peripheral hardware peculiar to a device. Used in combination with an in-circuit emulator.
NP-36GS <sup>Note 4</sup>	Board used to connect the in-circuit emulator to the target system. For a 30-pin plastic SSOP (MC-5A4 type), used in combination with NGS-30.
NGS-30 <sup>Note 4</sup> Conversion socket	Conversion socket used to connect the NP-36GS to the target system board designed to mount a 30-pin plastic SSOP (MC-5A4 type).

- Notes**
1. PC-9800 series (Japanese Windows™) based
  2. IBM PC/AT or compatibles (Japanese/English Windows) based
  3. HP9000 series 700™ (HP-UX™) based, SPARCstation™ (SunOS™, Solaris™) based.
  4. Products made by Naito Densetsu Machida Mfg. Co., Ltd. (Phone: +81-45-475-4191)

**Remark** RA78K0S, CC78K0S, SM78K0S, and ID78K0S-NS are used in combination with the DF789136.

**Debugging Tools (2/2)**

SM78K0S <sup>Notes 1, 2</sup>	System simulator common to 78K/0S Series
ID78K0S-NS <sup>Notes 1, 2</sup>	Integrated debugger common to 78K/0S Series
DF789136 <sup>Notes 1, 2</sup>	Device file for $\mu$ PD78F9116B

- Notes**
1. PC-9800 series (Japanese Windows) based
  2. IBM PC/AT or compatibles (Japanese/English Windows) based

**Remark** RA78K0S, CC78K0S, SM78K0S, and ID78K0S-NS are used in combination with the DF789136.

**NOTES FOR CMOS DEVICES**

**① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS**

Note:

Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

**② HANDLING OF UNUSED INPUT PINS FOR CMOS**

Note:

No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to  $V_{DD}$  or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

**③ STATUS BEFORE INITIALIZATION OF MOS DEVICES**

Note:

Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

## Regional Information

Some information contained in this document may vary from country to country. Before using any NEC product in your application, please contact the NEC office in your country to obtain a list of authorized representatives and distributors. They will verify:

- Device availability
- Ordering information
- Product release schedule
- Availability of related technical literature
- Development environment specifications (for example, specifications for third-party tools and components, host computers, power plugs, AC supply voltages, and so forth)
- Network requirements

In addition, trademarks, registered trademarks, export restrictions, and other legal issues may also vary from country to country.

- **The information in this document is current as of January, 2002. The information is subject to change without notice. For actual design-in, refer to the latest publications of NEC's data sheets or data books, etc., for the most up-to-date specifications of NEC semiconductor products. Not all products and/or types are available in every country. Please check with an NEC sales representative for availability and additional information.**
- No part of this document may be copied or reproduced in any form or by any means without prior written consent of NEC. NEC assumes no responsibility for any errors that may appear in this document.
- NEC does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from the use of NEC semiconductor products listed in this document or any other liability arising from the use of such products. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC or others.
- Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of customer's equipment shall be done under the full responsibility of customer. NEC assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.
- While NEC endeavours to enhance the quality, reliability and safety of NEC semiconductor products, customers agree and acknowledge that the possibility of defects thereof cannot be eliminated entirely. To minimize risks of damage to property or injury (including death) to persons arising from defects in NEC semiconductor products, customers must incorporate sufficient safety measures in their design, such as redundancy, fire-containment, and anti-failure features.
- NEC semiconductor products are classified into the following three quality grades:  
 "Standard", "Special" and "Specific". The "Specific" quality grade applies only to semiconductor products developed based on a customer-designated "quality assurance program" for a specific application. The recommended applications of a semiconductor product depend on its quality grade, as indicated below. Customers must check the quality grade of each semiconductor product before using it in a particular application.  
 "Standard": Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots  
 "Special": Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)  
 "Specific": Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems and medical equipment for life support, etc.

The quality grade of NEC semiconductor products is "Standard" unless otherwise expressly specified in NEC's data sheets or data books, etc. If customers wish to use NEC semiconductor products in applications not intended by NEC, they must contact an NEC sales representative in advance to determine NEC's willingness to support a given application.

(Note)

- (1) "NEC" as used in this statement means NEC Corporation and also includes its majority-owned subsidiaries.
- (2) "NEC semiconductor products" means any semiconductor product developed or manufactured by or for NEC (as defined above).
