FUNCTION DESCRIPTION

The KM736V687 is a synchronous SRAM designed to support the burst address accessing sequence of the Pentium and Power PC based microprocessor. All inputs (with the exception of \overline{OE} , LBO and ZZ) are sampled on rising clock edges. The start and duration of the burst access is controlled by \overline{ADSC} , \overline{ADSP} and \overline{ADV} and chip select pins.

When ZZ is pulled high, the SRAM will enter a Power Down State. At this time, internal state of the SRAM is preserved. When ZZ returns to low, the SRAM normally operates after 2 cycles of wake up time. ZZ pin is pulled down internally.

Read cycles are initiated with \overline{ADSP} (or \overline{ADSC}) using the new external address clocked into the on-chip address register when both \overline{GW} and \overline{BW} are high or when \overline{BW} is low and \overline{WEa} , \overline{WEb} , \overline{WEc} , and \overline{WEd} are high. When \overline{ADSP} is sampled low, the chip selects are sampled active, and the output buffer is enabled with \overline{OE} . the data of cell array accessed by the current address are projected to the output pins.

Write cycles are also initiated with \overline{ADSP} (or \overline{ADSC}) and are differentiated into two kinds of operations; All byte write operation and individual byte write operation.

All byte write occurs by enabling \overline{GW} (independent of \overline{BW} and \overline{WEx} .), and individual byte write is performed only when \overline{GW} is high and \overline{BW} is low. In KM736V687, a 64Kx36 organization, \overline{WEa} controls DQa0 ~ DQa7 and DQP_a, \overline{WEb} controls DQb0 ~ DQb7 and DQP_b, \overline{WEc} controls DQc0 ~ DQc7 and DQP_c and \overline{WEd} controls DQd0 ~ DQd7 and DQP_d.

\overline{CS}_1 is used to enable the device and conditions internal use of \overline{ADSP} and is sampled only when a new external address is loaded.

\overline{ADV} is ignored at the clock edge when \overline{ADSP} is asserted, but can be sampled on the subsequent clock edges. The address increases internally for the next access of the burst when \overline{ADV} is sampled low.

Addresses are generated for the burst access as shown below, The starting point of the burst sequence is provided by the external address. The burst address counter wraps around to its initial state upon completion. The burst sequence is determined by the state of the LBO pin. When this pin is Low, linear burst sequence is selected. And this pin is High, Interleaved burst sequence is selected.

BURST SEQUENCE TABLE

(Interleaved Burst)

\overline{LBO} PIN	HIGH	Case 1		Case 2		Case 3		Case 4	
		A ₁	A ₀	A ₁	A ₀	A ₁	A ₀	A ₁	A ₀
	First Address	0	0	0	1	1	0	1	1
	↓	0	1	0	0	1	1	1	0
	↓	1	0	1	1	0	0	0	1
	Fourth Address	1	1	1	0	0	1	0	0

(Linear Burst)

\overline{LBO} PIN	LOW	Case 1		Case 2		Case 3		Case 4	
		A ₁	A ₀	A ₁	A ₀	A ₁	A ₀	A ₁	A ₀
	First Address	0	0	0	1	1	0	1	1
	↓	0	1	1	0	1	1	0	0
	↓	1	0	1	1	0	0	0	1
	Fourth Address	1	1	0	0	0	1	1	0

NOTE : 1. \overline{LBO} pin must be tied to high or low, and floating state must not be allowed.

ASYNCHRONOUS TRUTH TABLE

(See Notes 1 and 2):

Operation	ZZ	\overline{OE}	I/O Status
Sleep Mode	H	X	High-Z
Read	L	L	DQ
	L	H	High-Z
Write	L	X	Din, High-Z
Deselected	L	X	High-Z

NOTE

1. X means "Don't Care".
2. ZZ pin is pulled down internally
3. For write cycles that following read cycles, the output buffers must be disabled with \overline{OE} , otherwise data bus contention will occur.
4. Sleep Mode means power down state of which stand-by current does not depend on cycle time.
5. Deselected means power down state of which stand-by current depends on cycle time.

H	X	X	X	H	H	L	↑	Current Address	Suspend Burst Write Cycle

- NOTE : 1. X means "Don't Care".
 2. The rising edge of clock is symbolized by ↑.
 3. $\overline{WRITE} = L$ means Write operation in WRITE TRUTH TABLE.
 $\overline{WRITE} = H$ means Read operation in WRITE TRUTH TABLE.
 4. Operation finally depends on status of asynchronous input pins(ZZ and \overline{OE}).

NOTE : 1. All address inputs must meet the specified setup and hold times for all rising clock edges whenever ADSC and/or ADSP is sampled low and CS is sampled low. All other synchronous inputs must meet the specified setup and hold times whenever this device is chip selected.
 2. Both chip selects must be active whenever ADSC or ADSP is sampled low in order for the this device to remain enabled.
 3. ADSC or ADSP must not be asserted for at least 2 Clock after leaving ZZ state.

APPLICATION INFORMATION

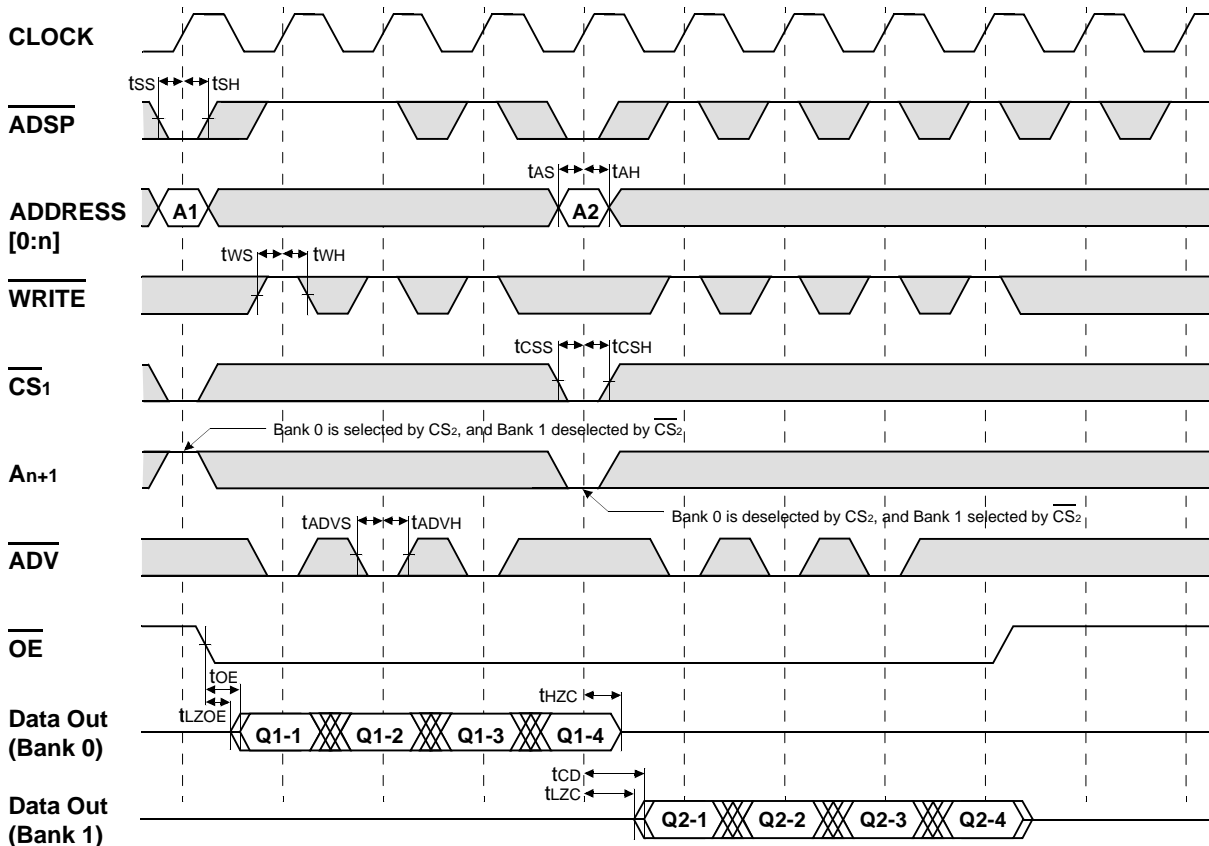

DEPTH EXPANSION

The Samsung 64Kx36 Synchronous Burst SRAM has two additional chip selects for simple depth expansion. This permits easy secondary cache upgrades from 64K depth to 128K depth without extra logic.
