

Description

The MK2704 is a low cost, low jitter, high performance PLL clock synthesizer designed to replace oscillators and PLL circuits in set-top box and multimedia systems. Using our patented analog Phase-Locked Loop (PLL) techniques, the device uses a fundamental 27 MHz crystal or clock input to produce a buffered reference clock and a selectable audio clock. The audio clock is frequency locked to the 27 MHz clock, assuring that the audio with zero ppm error and video will always track perfectly.

Features

- Packaged in 8 pin SOIC 
- Uses an inexpensive fundamental crystal, or clock
- Output clocks of 16.9344 MHz, 18.432 MHz, and 36.864 MHz
- Supports 384x MPEG sampling rates of 44.1 kHz, 48 kHz and 96 kHz
- Patented zero ppm synthesis error in all clocks
- All frequencies are frequency locked
- Advanced, low power, sub-micron CMOS process
- 3.3 V or 5 V operating voltage

- Notes: 1. Stresses beyond those listed under Absolute Maximum Ratings could cause permanent damage to the device. Prolonged exposure to levels above the operating limits but below the Absolute Maximums may affect device reliability.
2. CMOS level input. Nominal trip point is VDD/2 for 3.3 V or 5 V operation.

External Components

The MK2704 requires a minimum number of external components for proper operation. For a crystal input, one load capacitor should be connected from each of the X1 and X2 pins to ground. The value (in pF) of each crystal load capacitor should equal $(C_L - 16) \cdot 2$, where C_L is the crystal's load (correlation) capacitance in pF. The input crystal must be connected as close to the chip as possible. The input crystal should be a parallel resonant, fundamental, AT cut 27 MHz. For a clock input, connect to X1 and leave X2 unconnected. Decoupling capacitors of 0.01µF should be connected between VDD and GND on pins 2 and 3, as close to the MK2704 as possible. A series termination resistor of 33 Ω may be used for the clock output.
