TDA8205

NICAM QPSK DEMODULATOR

- HIGHLY INTEGRATED TWO CHIP SOLUTION FOR NICAM DEMODULATION (using TDA8204 decoder)
- AUTOMATIC DUAL STANDARD DEMODULATION 6.552MHz FOR I SYSTEM
5.85MHz FOR B/G SYSTEM
- 40dB RANGE AGC
- SINGLE CRYSTAL OPERATION
- NICAM 728 DATA AND CLOCK RECOVERY
- LOW PASS FILTER FOR PWM CODED AUDIO SIGNALS AND J-17 DE-EMPHASIS
- AUTOMATIC FM MONO SELECTION BY RESERVE SOUND SWITCH FUNCTION
- VERSATILE AUDIO SWITCHING MATRIX
- AUTOMATIC MUTE FUNCTION

DESCRIPTION

The TDA8205 is essentially divided into two signal processing sections. The first section handles all the NICAM signal acquisition, the QPSK demodulator and clock and data recovery circuits. The key point to note about this section is the dual frequency synthesiser. By use of only one quartz crystal, the IC is able to demodulate QPSK signals from either system I or system B/G in an automatic way. The second section of the TDA8205 manages the analog parts of the twin digital-to-analog converters (DACs) and all filtering and audio switching downstream of the DACs. A simple serial bus from the TDA8204 allows control of the switch functions by the CTV system microcontroller.

BLOCK DIAGRAM

8205-02.EPS

BLOCK DIAGRAM DESCRIPTION

The QPSK signal enters the IC via two inputs after passing through two external bandpass filters at the relevant frequencies of 6.552MHz and 5.85MHz for system I and B/G respectively. The two inputs enter a source selection switch and pass immediately to an AGC block which has a total range of 40dB. The resulting levelled signal passes

to the QPSK demodulator which recovers the NICAM 728Kb/s data stream by means of carrier and clock recovery circuits.

Carrier recovery is achieved with a baseband remodulator which consists of a phase locked loop with a switchable phase detector. This allows it to lock to one of four possible phases of the QPSK

carrier without disruption due to the modulation. Dual frequency operation is made possible by synthesising the carrier reference frequency thus saving the need for two extra crystals. Dual VCXO can also be software selected (SYN bit of CR3 in TDA8204) with external crystal (Pin XC1/XC2) for new standards. Selection between XC1 and XC2 is done with bit "IBG" in CR3 register of TDA8204 (IBG = 0 XC1 selected, IBG = 1 XC2 selected).

The standards switch controls operation of the QSPK demodulator at either 6.552MHz or 5.85MHz. This can be controlled via the I²C bus or the decoder set into automatic mode in which it determines the standard by alternately trying to lock to the two systems.

On chip low pass filters recover the in-phase and quadrature data channels which are then sliced by comparators. The symbol clock is recovered from this data and used to sample and re-time it. The two data channels are then decoded and serialized to obtain the NICAM-728 data which is then passed on to the NICAM decoder in the TDA8204.

After processing the NICAM into a digital bit-stream in the TDA8204, the data is passed back to the TDA8205 for the analog functions of the DACs to be performed.

Conversion of the pulse width modulated bit streams to analog takes place and is followed by low pass filtering which removes high frequency quantising noise and performs J-17 de-emphasis. The DACs signal level can be adjusted to match the reserve sound signal level.

1V_{RMS} maximum on Pins LFIL1/RFIL1 can be obtained by selection of appropriate resistor on Pin RG.

Once the analog audio has been recovered, certain source switch functions are performed. If the NICAM signal fails and if the reserve sound flag (C4), of SRO register, is set the reserve sound switch

automatically selects Mono Audio Input. If the reserve sound flag (C4) is reset, the reserve sound switch will not change and the audio outputs will be muted (DAC outputs muted).

If the NICAM signal only carries data, Mono Audio Input is selected. The reserve sound switch can be forced to select Mono Audio Input via I²C bus, using Bit FS0 = 1 and FS1 = 0 of CR3 Register.

This can be used in the case of NICAM marginal reception. To select Stereo Left and Right Audio Input Bit FS0 = 0 and FS1 = 1 of CR3 Register must be selected. The outputs from this reserve sound switch are available on Audio mutable output left and right, and are internally connected to the audio matrix.

A simple audio switching matrix is provided internally for flexible control over the audio source and destination selection.

Audio signal left and right coming from the reserve sound switch and the external audio input left and right can be switched to the audio outputs left and right.

DAC and auxiliary audio outputs can be muted. An additional +6dB gain can be applied to raise the output levels to 2VRMS maximum. For more information see Software Specification chapter (III.5.3/TDA8204).

The DAC outputs are automatically muted under the following conditions

- loss of frame alignment
- the bit error rate (Ber) is > error rate limit
- NICAM signal is conveying M1 only. The right DAC is muted unless M1 has been selected to be on both DAC outputs.
- NICAM signal is conveying data only.

For test purposes, the DAC outputs can be unmuted by forcing the bi-directional mute Pin 25 of TDA8204 or via I²C bus.

ABSOLUTE MAXIMUM RATINGS

| Symbol | Parameter | Value | Unit |
|-------------------|-----------------------------|------------|------|
| V _{CC} | Supply Voltage | 15 | V |
| V _{DD} | Supply Voltage | 7 | V |
