Timing Diagram

Figure 2-11. Hub Differential Delay, Differential Jitter, and SOP Distortion

Hub Differential Jitter:

$$t_{HDJ1} = t_{HDDx}(J) - t_{HDDx}(K) \text{ or } t_{HDDx}(K) - t_{HDDx}(J) \quad \text{Consecutive Transitions}$$

$$t_{HDJ2} = t_{HDDx}(J) - t_{HDDx}(J) \text{ or } t_{HDDx}(K) - t_{HDDx}(K) \quad \text{Paired Transitions}$$

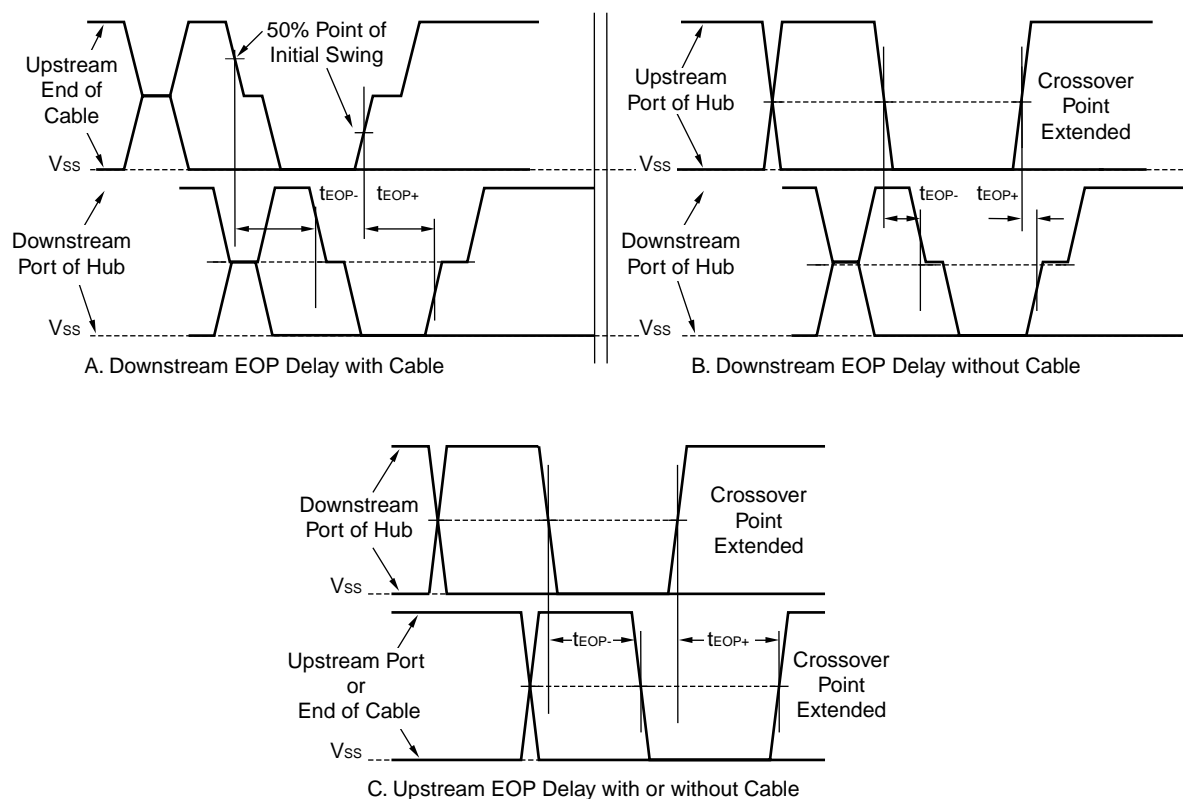

Bit after SOP Width Distortion (same as data jitter for SOP and next J transition):

$$t_{FSOP} = t_{HDDx}(\text{next J}) - t_{HDDx}(\text{SOP})$$

Low-speed timings are determined in the same way for:

$$t_{LHDD}, t_{LDHJ1}, t_{LDJH2}, t_{LUHJ1}, t_{LUJH2}, \text{ and } t_{LSOP}$$

Figure 2-12. Hub EOP Delay and EOP Skew

EOP Delay:

$$t_{FEOPD} = t_{EOPy} - t_{HDDx}$$

(t_{EOPy} means that this equation applies to t_{EOP-} and t_{EOP+})

EOP Skew:

$$t_{FHESK} = t_{EOP+} - t_{EOP-}$$

Low-speed timings are determined in the same way for:

t_{LEOPD} and t_{LHESK}

NOTES FOR CMOS DEVICES

① VOLTAGE APPLICATION WAVEFORM AT INPUT PIN

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (MAX) and V_{IH} (MIN) due to noise, etc., the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (MAX) and V_{IH} (MIN).

② HANDLING OF UNUSED INPUT PINS

Unconnected CMOS device inputs can be cause of malfunction. If an input pin is unconnected, it is possible that an internal input level may be generated due to noise, etc., causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND via a resistor if there is a possibility that it will be an output pin. All handling related to unused pins must be judged separately for each device and according to related specifications governing the device.

③ PRECAUTION AGAINST ESD

A strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it when it has occurred. Environmental control must be adequate. When it is dry, a humidifier should be used. It is recommended to avoid using insulators that easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors should be grounded. The operator should be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with mounted semiconductor devices.

④ STATUS BEFORE INITIALIZATION

Power-on does not necessarily define the initial status of a MOS device. Immediately after the power source is turned ON, devices with reset functions have not yet been initialized. Hence, power-on does not guarantee output pin levels, I/O settings or contents of registers. A device is not initialized until the reset signal is received. A reset operation must be executed immediately after power-on for devices with reset functions.

⑤ POWER ON/OFF SEQUENCE

In the case of a device that uses different power supplies for the internal operation and external interface, as a rule, switch on the external power supply after switching on the internal power supply. When switching the power supply off, as a rule, switch off the external power supply and then the internal power supply. Use of the reverse power on/off sequences may result in the application of an overvoltage to the internal elements of the device, causing malfunction and degradation of internal elements due to the passage of an abnormal current.

The correct power on/off sequence must be judged separately for each device and according to related specifications governing the device.

⑥ INPUT OF SIGNAL DURING POWER OFF STATE

Do not input signals or an I/O pull-up power supply while the device is not powered. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Input of signals during the power off state must be judged separately for each device and according to related specifications governing the device.
