## HIGH PERFORMANCE CURRENT MODE PWM CONTROLLER

- TRIMMED OSCILLATOR FOR PRECISE FREQUENCY CONTROL
- OSCILLATOR FREQUENCY GUARANTEED AT 250kHz
- CURRENT MODE OPERATION TO 500kHz
- AUTOMATIC FEED FORWARD COMPENSATION
- LATCHING PWM FOR CYCLE-BY-CYCLE CURRENT LIMITING
- INTERNALLY TRIMMED REFERENCE WITH UNDERVOLTAGE LOCKOUT
- HIGH CURRENT TOTEM POLE OUTPUT
- UNDERVOLTAGE LOCKOUT WITH HYSTERESIS
- LOW START-UP AND OPERATING CURRENT

comparator which also provides current limit control, and a totem pole output stage designed to source or sink high peak current. The output stage, suitable for driving N-Channel MOSFETs, is low in the off-state.

### DESCRIPTION

The UC384XT family of control ICs provides the necessary features to implement off-line or DC to DC fixed frequency current mode control schemes with a minimal external parts count. Internally implemented circuits include a trimmed oscillator for precise DUTY CYCLE CONTROL under voltage lockout featuring start-up current less than 0.5mA, a precision reference trimmed for accuracy at the error amp input, logic to insure latched operation, a PWM

Differences between members of this family are the under-voltage lockout thresholds and maximum duty cycle ranges. The UC3842T and UC3844T have UVLO thresholds of 16V (on) and 10V (off), ideally suited to off-line applications. The corresponding thresholds for the UC3843T and UC3845T are 8.5 V and 7.9 V. The UC3842T and UC3843T can operate to duty cycles approaching 100%. A range of zero to < 50 % is obtained by the UC3844T and UC3845T by the addition of an internal toggle flip flop which blanks the output off every other clock cycle.

### BLOCK DIAGRAM (toggle flip flop used only in UC3844T and UC3845T)

### ABSOLUTE MAXIMUM RATINGS

| Symbol           | Parameter   | Value         | Unit             |
|------------------|---|---------------|------------------|
| $V_i$            | Supply Voltage (low impedance source)   | 30            | V                |
| $V_i$            | Supply Voltage ( $I_i < 30\text{mA}$ )  | Self Limiting |                  |
| $I_o$            | Output Current  | $\pm 1$       | A                |
| $E_o$            | Output Energy (capacitive load)   | 5             | $\mu\text{J}$    |
|                  | Analog Inputs (pins 2, 3)   | - 0.3 to 5.5  | V                |
|                  | Error Amplifier Output Sink Current   | 10            | mA               |
| $P_{\text{tot}}$ | Power Dissipation at $T_{\text{amb}} \leq 25\text{ }^\circ\text{C}$ (Minidip) | 1.25          | W                |
| $P_{\text{tot}}$ | Power Dissipation at $T_{\text{amb}} \leq 25\text{ }^\circ\text{C}$ (SO8)     | 800           | mW               |
| $T_{\text{stg}}$ | Storage Temperature Range   | - 65 to 150   | $^\circ\text{C}$ |
| $T_L$            | Lead Temperature (soldering 10s)  | 300           | $^\circ\text{C}$ |

\* All voltages are with respect to pin 5, all currents are positive into the specified terminal.

### PIN CONNECTION (top view)

### PIN FUNCTIONS

| No | Function           | Description  |
|----|--------------------|--|
| 1  | COMP               | This pin is the Error Amplifier output and is made available for loop compensation.  |
| 2  | $V_{\text{FB}}$    | This is the inverting input of the Error Amplifier. It is normally connected to the switching power supply output through a resistor divider.  |
| 3  | $I_{\text{SENSE}}$ | A voltage proportional to inductor current is connected to this input. The PWM uses this information to terminate the output switch conduction.  |
| 4  | $R_T/C_T$          | The oscillator frequency and maximum Output duty cycle are programmed by connecting resistor $R_T$ to $V_{\text{ref}}$ and capacitor $C_T$ to ground. Operation to 500kHz is possible. |
| 5  | GROUND             | This pin is the combined control circuitry and power ground.   |
| 6  | OUTPUT             | This output directly drives the gate of a power MOSFET. Peak currents up to 1A are sourced and sunk by this pin.   |
| 7  | $V_{\text{CC}}$    | This pin is the positive supply of the control IC.   |
| 8  | $V_{\text{ref}}$   | This is the reference output. It provides charging current for capacitor $C_T$ through resistor $R_T$ .  |

- Notes :**
1. Max package power dissipation limits must be respected; low duty cycle pulse techniques are used during test maintain T<sub>j</sub> as close to T<sub>amb</sub> as possible.
  2. These parameters, although guaranteed, are not 100% tested in production.
  3. Parameter measured at trip point of latch with V<sub>PIN2</sub> = 0.
  4. Gain defined as :
 
$$A = \frac{\Delta V_{PIN1}}{\Delta V_{PIN3}} ; 0 \leq V_{PIN3} \leq 0.8 \text{ V}$$
  5. Adjust V<sub>i</sub> above the start threshold before setting at 15 V.

Figure 1: Open Loop Test Circuit.

High peak currents associated with capacitive loads necessitate careful grounding techniques. Timing and bypass capacitors should be connected close

to pin 5 in a single point ground. The transistor and 5 KΩ potentiometer are used to sample the oscillator waveform and apply an adjustable ramp to pin 3.

Figure 17 : Current Sense Circuit .

Peak current ( $i_s$ ) is determined by the formula

$$I_{s \max} \approx \frac{1.0 \text{ V}}{R_s}$$

A small RC filter may be required to suppress switch transients.
