### CPD Applications

This document describes how to design a platform with a common footprint for the MPC750, MPC755, MPC7400, and MPC7410; that is, it is intended to help design a single board compatible with all of these devices. Although this document contains relevant information, it is not intended to be a complete migration guide for moving from G3- to G4-class systems.

As a general note, refer to the appropriate hardware specifications and user's manual for the specific device under consideration.

For this document, the following system definition is assumed for the MPC750, MPC755, MPC7400 and MPC7410:

- 64-bit data bus mode
- No data retry
- Bus operates in 60x mode

Note that all the CPUs can run in 60x bus, and the MPC7400 and MPC7410 have the ability to run in an enhanced mode MPX.

## 1.1 Main Pin Difference

This section includes Table 1 which lists the main differences between the MPC750, MPC755, MPC7400 and MPC7410 and the configuration pins. The MPX bus column provides information for designers to take advantage of the MPX bus mode for future board revisions.

<sup>2</sup> DTI[0:2] should be pulled low in MPX bus mode to disable re-ordering.

## 1.2 I/O Voltage Selection

This section lists the four footprint power planes and displays the section matrix for the I/O voltages.

In addition, the footprint should have four power planes:

- Ground
- The CPU core voltage, [VDD]
- The I/O voltage for the system bus, [OVDD]
- The I/O voltage for the L2 SRAM interface, [L2OVDD]

The I/O voltages [OVDD and L2OVDD] are selectable on all the CPUs except the MPC750, which supports 3.3V only on both of these interfaces.

Table 2 and Table 3 show the selection matrix for the I/O voltages:

Table 2. I/O Voltage Selection—BVSEL

BVSEL	MPC750	MPC755	MPC7400	MPC7410 (Rev E)
0	N/A	N/A	1.8V	1.8V

Table 4 pertains to the remaining pins, and the comments are valid for the common footprint.
