## 1N5817, 1N5818, 1 N5819

## Axial Lead Rectifiers

...employing the Schottky Barrier principle in a large area metal-to-silicon power diode. State-of-the-art geometry features chrome barrier metal, epitaxial construction with oxide passivation and metal overlap contact. Ideally suited for use as rectifiers in low-voltage, high-frequency inverters, free wheeling diodes, and polarity protection diodes.

- Extremely Low $\mathrm{V}_{\mathrm{F}}$
- Low Stored Charge, Majority Carrier Conduction
- Low Power Loss/High Efficiency

## Mechanical Characteristics

- Case: Epoxy, Molded
- Weight: 0.4 gram (approximately)
- Finish: All External Surfaces Corrosion Resistant and Terminal Leads are Readily Solderable
- Lead and Mounting Surface Temperature for Soldering Purposes: $220^{\circ} \mathrm{C}$ Max. for 10 Seconds, $1 / 16^{\prime \prime}$ from case
- Shipped in plastic bags, 1000 per bag.
- Available Tape and Reeled, 5000 per reel, by adding a "RL" suffix to the part number
- Polarity: Cathode Indicated by Polarity Band
- Marking: 1N5817, 1N5818, 1N5819

## MAXIMUM RATINGS

## NOTE 1. - DETERMINING MAXIMUM RATINGS

Reverse power dissipation and the possibility of thermal runaway must be considered when operating this rectifier at reverse voltages above $0.1 \mathrm{~V}_{\mathrm{RWM}}$. Proper derating may be accomplished by use of equation (1).

$$
\begin{align*}
\mathrm{T}_{\mathrm{A}(\max )}= & \mathrm{T}_{J(\max )}-\mathrm{R}_{\theta \mathrm{JJA}} \mathrm{P}_{\mathrm{F}(\mathrm{AV})}-\mathrm{R}_{\theta \mathrm{BA}} \mathrm{P}_{\mathrm{R}(\mathrm{AV})}  \tag{1}\\
\text { where } \mathrm{T}_{\mathrm{A}(\max )}= & \text { Maximum allowable ambient temperature } \\
\mathrm{T}_{\mathrm{J}(\max )}= & \text { Maximum allowable junction temperature } \\
& \text { (125}{ }^{\circ} \mathrm{C} \text { or the temperature at which thermal } \\
& \text { runaway occurs, whichever is lowest) } \\
\mathrm{P}_{\mathrm{F}(\mathrm{AV})}= & \text { Average forward power dissipation } \\
\mathrm{P}_{\mathrm{R}(\mathrm{AV})}= & \text { Average reverse power dissipation } \\
\mathrm{R}_{\theta J A}= & \text { Junction-to-ambient thermal resistance }
\end{align*}
$$

igures 1, 2, and 3 permit easier use of equation (1) by taking reverse power dissipation and thermal runaway into consideration. The figures solve for a reference temperature as determined by equation (2).

$$
\begin{equation*}
\mathrm{T}_{\mathrm{R}}=\mathrm{T}_{\mathrm{J}(\max )}-\mathrm{R}_{\theta \mathrm{JA}} \mathrm{P}_{\mathrm{R}(\mathrm{AV})} \tag{2}
\end{equation*}
$$

Substituting equation (2) into equation (1) yields:

$$
\begin{equation*}
T_{A(\text { max })}=T_{R}-R_{\text {UJA }} P_{F(A V)} \tag{3}
\end{equation*}
$$

Inspection of equations (2) and (3) reveals that $T_{R}$ is the ambient temperature at which thermal runaway occurs or where $\mathrm{T}_{\mathrm{J}}=125^{\circ} \mathrm{C}$, when forward power is zero. The transition from one boundary condition to the other is evident on the curves of Figures 1, 2, and 3 as a difference in the rate of change of the slope in the vicinity of $115^{\circ} \mathrm{C}$. The data of Figures 1, 2, and 3 is based upon dc conditions. For use in common rectifier circuits, Table 1 indicates suggested factors for an equivalent dc voltage to use for conservative design, that is:

$$
\begin{equation*}
V_{R(\text { equiv })}=V_{\text {in }(\mathrm{PK})} \times F \tag{4}
\end{equation*}
$$

The factor $F$ is derived by considering the properties of the various rectifier circuits and the reverse characteristics of Schottky diodes.

EXAMPLE: Find $\mathrm{T}_{\mathrm{A}(\max )}$ for 1 N 5818 operated in a 12 -volt dc supply using a bridge circuit with capacitive filter such that $\mathrm{I}_{\mathrm{DC}}=0.4 \mathrm{~A}\left(\mathrm{I}_{\mathrm{F}(\mathrm{AV})}=0.5 \mathrm{~A}\right), \mathrm{I}_{(\mathrm{FM})} / \mathrm{I}_{(\mathrm{AV})}=10$, Input Voltage $=10 \mathrm{~V}_{(\mathrm{rms})}, \mathrm{R}_{\theta \mathrm{JA}}=80^{\circ} \mathrm{C} / \mathrm{W}$.

Step 1. Find $V_{R(e q u i v) . ~ R e a d ~}^{F}=0.65$ from Table 1,

$$
\therefore \mathrm{V}_{\mathrm{R}(\text { equiv) })}=(1.41)(10)(0.65)=9.2 \mathrm{~V} \text {. }
$$

Step 2. Find $T_{R}$ from Figure 2. Read $T_{R}=109^{\circ} \mathrm{C}$

$$
@ V_{R}=9.2 \mathrm{~V} \text { and } \mathrm{R}_{\theta \mathrm{JA}}=80^{\circ} \mathrm{C} / \mathrm{W}
$$

Step 3. Find $\mathrm{P}_{\mathrm{F}(\mathrm{AV})}$ from Figure 4. ${ }^{* *}$ Read $\mathrm{P}_{\mathrm{F}(\mathrm{AV})}=0.5 \mathrm{~W}$

$$
@ \frac{\mathrm{I}_{(\mathrm{FM})}}{\mathrm{I}_{(\mathrm{AV})}}=10 \text { and } \mathrm{IF}(\mathrm{AV})=0.5 \mathrm{~A} .
$$

Step 4. Find $\mathrm{T}_{\mathrm{A}(\max )}$ from equation (3).

$$
\mathrm{T}_{\mathrm{A}(\max )}=109-(80)(0.5)=69^{\circ} \mathrm{C}
$$

**Values given are for the 1 N5818. Power is slightly lower for the 1N5817 because of its lower forward voltage, and higher for the 1N5819.

| 3 | 50 |  |  |  |  |
| ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |  |  |  |  |  |

## 1N5817, 1N5818, 1N5819

NOTE 3. - THERMAL CIRCUIT MODEL
(For heat conduction through the leads)

Use of the above model permits junction to lead thermal resistance for any mounting configuration to be found. For a given total lead length, lowest values occur when one side of the rectifier is brought as close as possible to the heatsink. Terms in the model signify:
$\mathrm{T}_{\mathrm{A}}=$ Ambient Temperature $\quad \mathrm{T}_{\mathrm{C}}=$ Case Temperature
$T_{L}=$ Lead Temperature $\quad T_{J}=$ Junction Temperature
$\mathrm{R}_{\theta \mathrm{S}}=$ Thermal Resistance, Heatsink to Ambient
$\mathrm{R}_{\theta \mathrm{L}}=$ Thermal Resistance, Lead to Heatsink
$\mathrm{R}_{\theta \mathrm{J}}=$ Thermal Resistance, Junction to Case
$P_{D}=$ Power Dissipation

Figure 7. Typical Forward Voltage
(Subscripts A and K refer to anode and cathode sides, respectively.) Values for thermal resistance components are:
$R_{\theta L}=100^{\circ} \mathrm{C} / \mathrm{W} /$ in typically and $120^{\circ} \mathrm{C} / \mathrm{W} /$ in maximum $R_{\theta J}=36^{\circ} \mathrm{C} / \mathrm{W}$ typically and $46^{\circ} \mathrm{C} / \mathrm{W}$ maximum.

Figure 8. Maximum Non-Repetitive Surge Current

Figure 9. Typical Reverse Current

## NOTE 4. - HIGH FREQUENCY OPERATION

Since current flow in a Schottky rectifier is the result of majority carrier conduction, it is not subject to junction diode forward and reverse recovery transients due to minority carrier injection and stored charge. Satisfactory circuit analysis work may be performed by using a model consisting of an ideal diode in parallel with a variable capacitance. (See Figure 10.)

Rectification efficiency measurements show that operation will be satisfactory up to several megahertz. For example, relative waveform rectification efficiency is approximately 70 percent at 2.0 MHz , e.g., the ratio of dc power to RMS power in the load is 0.28 at this frequency, whereas perfect rectification would yield 0.406 for sine wave inputs. However, in contrast to ordinary junction diodes, the loss in waveform efficiency is not indicative of power loss: it is simply a result of reverse current flow through the diode capacitance, which lowers the dc output voltage.
