

Designer's™ Data Sheet
SWITCHMODE™
NPN Bipolar Power Transistor
For Switching Power Supply Applications

The MJE/MJF18002 have an applications specific state-of-the-art die designed for use in 220 V line operated Switchmode Power supplies and electronic light ballasts. These high voltage/high speed transistors offer the following:

- Improved Efficiency Due to Low Base Drive Requirements:
 - High and Flat DC Current Gain h_{FE}
 - Fast Switching
 - No Coil Required in Base Circuit for Turn-Off (No Current Tail)
- Tight Parametric Distributions are Consistent Lot-to-Lot
- Two Package Choices: Standard TO-220 or Isolated TO-220
- MJF18002, Case 221D, is UL Recognized at 3500 V_{RMS} : File #E69369

MAXIMUM RATINGS

| Rating | Symbol | MJE18002 | MJF18002 | Unit |
|--|----------------|------------|----------------------|---------------|
| Collector-Emitter Sustaining Voltage | V_{CEO} | 450 | | Vdc |
| Collector-Emitter Breakdown Voltage | V_{CES} | 1000 | | Vdc |

GUARANTEED SAFE OPERATING AREA INFORMATION

Figure 15. Forward Bias Safe Operating Area

Figure 16. Reverse Bias Switching Safe Operating Area

Figure 17. Forward Bias Power Derating

There are two limitations on the power handling ability of a transistor: average junction temperature and second breakdown. Safe operating area curves indicate I_C - V_{CE} limits of the transistor that must be observed for reliable operation; i.e., the transistor must not be subjected to greater dissipation than the curves indicate. The data of Figure 15 is based on $T_C = 25^\circ\text{C}$; $T_J(\text{pk})$ is variable depending on power level. Second breakdown pulse limits are valid for duty cycles to 10% but must be derated when $T_C > 25^\circ\text{C}$. Second breakdown limitations do not derate the same as thermal limitations. Allowable current at the voltages shown on Figure 15 may be found at any case temperature by using the appropriate curve on Figure 17. $T_J(\text{pk})$ may be calculated from the data in Figures 20 and 21. At any case temperatures, thermal limitations will reduce the power that can be handled to values less the limitations imposed by second breakdown. For inductive loads, high voltage and current must be sustained simultaneously during turn-off with the base to emitter junction reverse biased. The safe level is specified as a reverse biased safe operating area (Figure 16). This rating is verified under clamped conditions so that the device is never subjected to an avalanche mode.
