

## Features

- Contains two echo cancellers: 112ms acoustic echo canceller + 16ms line echo canceller
- Works with low cost voice codec. ITU-T G.711 or signed mag  $\mu$ /A-Law, or linear 2's comp
- Each port may operate in different format.
- Advanced NLP design - full duplex speech with no switched loss on audio paths
- Fast re-convergence time: tracks changing echo environment quickly
- Adaptation algorithm converges even during Double-Talk
- Designed for exceptional performance in high background noise environments
- Provides protection against narrow-band signal divergence
- Howling prevention stops uncontrolled oscillation in high loop gain conditions
- Offset nulling of all PCM channels
- Serial micro-controller interface
- ST-BUS or variable-rate SSI PCM interfaces
- User gain control provided for speaker path (-24dB to +21dB in 3dB steps)
- AGC on speaker path

DS5038

ISSUE 3

February 1999

## Ordering Information

MT9315AP	28 Pin PLCC
MT9315AE	28 Pin PDIP

**-40 °C to + 85 °C**

- Handles up to 0 dB acoustic echo return loss and 0dB line ERL
- Transparent data transfer and mute options
- 20 MHz master clock operation
- Low power mode during PCM Bypass

## Applications

- Full duplex speaker-phone for digital telephone
- Echo cancellation for video conferencing
- Handsfree in automobile environment
- Full duplex speaker-phone for PC

Figure 1 - Functional Block Diagram

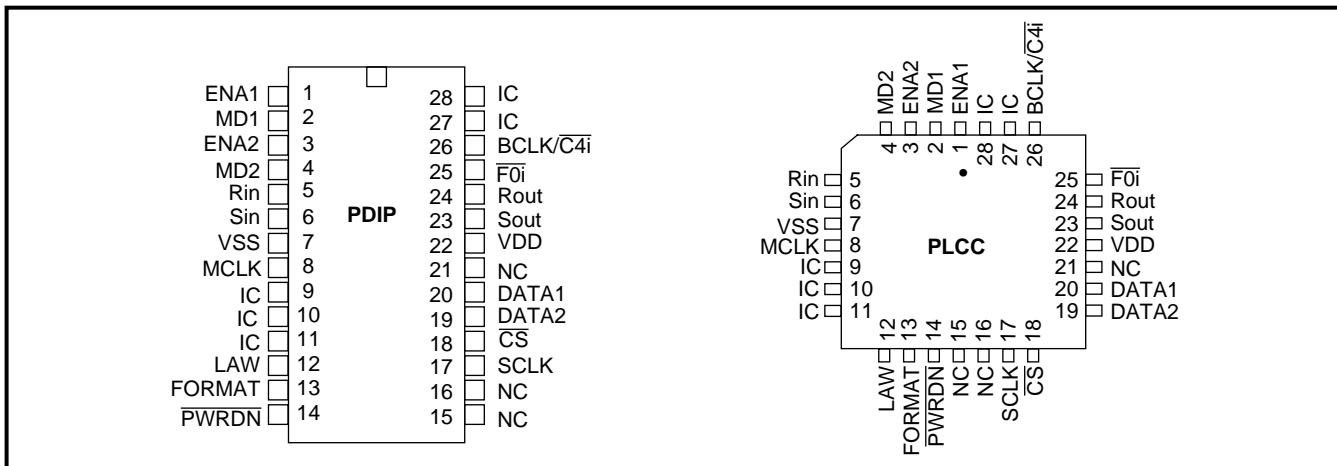

Figure 2 - Pin Connections

Pin Description

Pin #	Name	Description
1	ENA1	<b>SSI Enable Strobe / ST-BUS Mode for Rin/Sout (Input).</b> This pin has dual functions depending on whether SSI or ST-BUS is selected. For SSI, this strobe must be present for frame synchronization. This is an active high channel enable strobe, 8 or 16 data bits wide, enabling serial PCM data transfer for on Rin/Sout pins. Strobe period is 125 microseconds. For ST-BUS, this pin, in conjunction with the MD1 pin, will select the proper ST-BUS mode for Rin/Sout pins (see ST-BUS Operation description).
2	MD1	<b>ST-BUS Mode for Rin/Sout (Input).</b> When in ST-BUS mode, this pin, in conjunction with the ENA1 pin, will select the proper ST-BUS mode for Rin/Sout pins (see ST-BUS Operation description). Connect this pin to Vss in SSI mode.
3	ENA2	<b>SSI Enable Strobe / ST-BUS Mode for Sin/Rout (Input).</b> This pin has dual functions depending on whether SSI or ST-BUS is selected. For SSI, this is an active high channel enable strobe, 8 or 16 data bits wide, enabling serial PCM data transfer on Sin/Rout pins. Strobe period is 125 microseconds. For ST-BUS, this pin, in conjunction with the MD2 pin, will select the proper ST-BUS mode for Sin/Rout pins (see ST-BUS Operation description).
4	MD2	<b>ST-BUS Mode for Sin/Rout (Input).</b> When in ST-BUS mode, this pin in conjunction with the ENA2 pin, will select the proper ST-BUS mode for Sin/Rout pins (see ST-BUS Operation description). Connect this pin to Vss in SSI mode.
5	Rin	<b>Receive PCM Signal Input (Input).</b> 128 kbit/s to 4096 kbit/s serial PCM input stream. Data may be in either companded or 2's complement linear format. This is the Receive Input channel from the line (or line) side. Data bits are clocked in following SSI or ST-BUS timing requirements.
6	Sin	<b>Send PCM Signal Input (Input).</b> 128 kbit/s to 4096 kbit/s serial PCM input stream. Data may be in either companded or 2's complement linear format. This is the Send Input channel (from the microphone). Data bits are clocked in following SSI or ST-BUS timing requirements.
7	VSS	<b>Digital Ground:</b> Nominally 0 volt.
8	MCLK	<b>Master Clock (Input):</b> Nominal 20 MHz Master Clock input. May be connected to an asynchronous (relative to frame signal) clock source.
9	IC	<b>Internal Connection (Input):</b> Must be tied to Vss.
10, 11	IC	<b>Internal Connection (Input).</b> Tie to Vss.
12	LAW	<b>A/μ Law Select (Input).</b> When low, selects μ-Law companded PCM. When high, selects A-Law companded PCM. This control is for both serial pcm ports.

## Pin Description (continued)

Pin #	Name	Description
13	FORMAT	<b>ITU-T/Sign Mag (Input).</b> When low, selects sign-magnitude PCM code. When high, selects ITU-T (G.711) PCM code. This control is for both serial pcm ports.
14	$\overline{\text{PWRDN}}$	<b>Power-down (Input).</b> An active low resets the device and puts the MT9315 into a low-power stand-by mode.
15, 16	NC	<b>No Connect (Output).</b> This pin should be left un-connected.
17	SCLK	<b>Serial Port Synchronous Clock (Input).</b> Data clock for the serial microport interface.
18	$\overline{\text{CS}}$	<b>Serial Port Chip Select (Input).</b> Enables serial microport interface data transfers. Active low.
19	DATA2	<b>Serial Data Receive (Input).</b> In Motorola/National serial microport operation, the DATA2 pin is used for receiving data. In Intel serial microport operation, the DATA2 pin is not used and must be tied to Vss or Vdd.
20	DATA1	<b>Serial Data Port (Bidirectional).</b> In Motorola/National serial microport operation, the DATA1 pin is used for transmitting data. In Intel serial microport operation, the DATA1 pin is used for transmitting and receiving data.
21	NC	<b>No Connect (Output).</b> This pin should be left un-connected.
22	VDD	Positive Power Supply. Nominal is 5V
23	Sout	<b>Send PCM Signal Output (Output).</b> 128 kbit/s to 4096 kbit/s serial PCM output stream. Data may be in either companded or 2's complement linear PCM format. This is the Send Out signal after acoustic echo cancellation and Non-linear processing. Data bits are clocked out following SSI or ST-BUS timing requirements.
24	Rout	<b>Receive PCM Signal Output (Output).</b> 128 kbit/s to 4096 kbit/s serial PCM output stream. Data may be in either companded or 2's complement linear PCM format. This is the Receive out signal after line echo cancellation Non-linear processing, AGC, and gain control. Data bits are clocked out following SSI or ST-BUS timing requirements.
25	$\overline{\text{F0i}}$	<b>Frame Pulse (Input).</b> In ST-BUS operation, this is an active-low frame alignment pulse. SSI operation is enabled by connecting this pin to Vss.
26	BCLK/ $\overline{\text{C4i}}$	<b>Bit Clock/ST-BUS Clock (Input).</b> In SSI operation, BCLK pin is a 128 kHz to 4.096 MHz bit clock. This clock must be synchronous with ENA1, and ENA2 enable strobes. In ST-BUS operation, $\overline{\text{C4i}}$ pin must be connected to the 4.096MHz (C4) system clock.
27, 28	IC	<b>Internal Connection (Input).</b> Tie to Vss.

## Notes:

- All inputs have TTL compatible logic levels except for MCLK, Sin and Rin pins which have CMOS compatible logic levels and  $\overline{\text{PWRDN}}$  pin which has Schmitt trigger compatible logic levels.
- All outputs are CMOS pins with CMOS logic levels except DATA1 which is TTL bidirectional.

## Glossary

Double-Talk	Simultaneous signals present on Rin and Sin.
Near-end Single-Talk	Signals only present at Sin input.
Far-end Single-Talk	Signals only present at Rin input.
ADV NLP	Advanced Non-Linear-Processor
Howling	Oscillation caused by feedback from acoustic and line echo paths
Narrowband	Any mono or dual sinusoidal signals
NBSD	Narrow Band Signal Detector
Noise-Gating	Audible switching of background noise
Offset Nulling	Removal of DC component
Reverberation time	The time duration before an echo level decays to -60dBm
ERL	Echo Return Loss
ERLE	Echo Return Loss Enhancement
AGC	Automatic Gain Control

## Functional Description

The MT9315 device contains two echo cancellers, as well as the many control functions necessary to operate the echo cancellers. One canceller is for acoustic speaker to microphone echo, and one for line echo cancellation. The MT9315 provides clear signal transmission in both audio path directions to ensure reliable voice communication, even with low level signals. The MT9315 does not use variable attenuators during double-talk or single-talk periods of speech, as do many other acoustic echo cancellers for speaker-phones. Instead, the MT9315 provides high performance full-duplex operation similar to network echo cancellers, so that users experience clear speech and un-interrupted background signals during the conversation. This prevents subjective sound quality problems associated with “noise gating” or “noise contrasting”.

The MT9315 uses an advanced adaptive filter algorithm that is double-talk stable, which means that convergence takes place even while both parties are talking <sup>1</sup>. This algorithm allows continual tracking of changes in the echo path, regardless of double-talk, as long as a reference signal is available for the echo canceller.

*(1. Patent Pending)*

The echo tail cancellation capability of the acoustic echo canceller has been sized appropriately (112ms) to cancel echo in an average sized office with a reverberation time of less than 112ms. The 16ms line echo canceller is sufficient to ensure a high ERLE for most line circuits.

In addition to the echo cancellers, the following functions are supported:

- Control of adaptive filter convergence speed during periods of double-talk, far end single-talk, and near-end echo path changes.
- Control of Non-Linear Processor thresholds for suppression of residual non-linear echo.
- Howling detector to identify when instability is starting to occur, and to take action to prevent oscillation.
- Narrow-Band Detector for preventing adaptive filter divergence caused by narrow-band signals
- Offset Nulling filters for removal of DC components in PCM channels.
- Limiters that introduce controlled saturation levels.
- Serial controller interface compatible with Motorola, National and Intel microcontrollers.
- PCM encoder/decoder compatible with  $\mu$ /A-

Law ITU-T G.711,  $\mu$ /A-Law Sign-Mag or linear 2's complement coding.

- Automatic gain control on the receive speaker path.

## Adaptation Speed Control

The adaptation speed of the acoustic echo canceller is designed to optimize the convergence speed versus divergence caused by interfering near-end signals. Adaptation speed algorithm takes into account many different factors such as relative double-talk condition, far end signal power, echo path change, and noise levels to achieve fast convergence.

## Advanced Non-Linear Processor (ADV-NLP)<sup>2</sup>

*(2. Patent Pending)*

After echo cancellation, there is likely to be residual echo which needs to be removed so that it will not be audible. The MT9315 uses an NLP to remove low level residual echo signals which are not comprised of background noise. The operation of the NLP depends upon a dynamic activation threshold, as well as a double-talk detector which disables the NLP during double-talk periods.

The MT9315 keeps the perceived noise level constant, without the need for any variable attenuators or gain switching that causes audible “noise gating”. The noise level is constant and identical to the original background noise even when the NLP is activated.

For each audio path, the NLP can be disabled by setting the NLP- bit to 1 in the LEC or AEC control registers.

## Narrow Band Signal Detector (NBSD)<sup>3</sup>

*(3. Patent Pending)*

Single or multi-frequency tones (e.g. DTMF, or signalling tones) present in the reference input of an echo canceller for a prolonged period of time may cause the adaptive filter to diverge. The Narrow Band Signal Detector (NBSD) is designed to prevent this divergence by detecting single or multi-tones of arbitrary frequency, phase, and amplitude. When narrow band signals are detected, the filter adaptation process is stopped but the echo canceller continues to cancel echo.

The NBSD can be disabled by setting the NB- bit to 1 in the MC control registers.

**Howling Detector (HWLD) <sup>4</sup>***(4. Patent Pending)*

The Howling detector is part of an Anti-Howling control, designed to prevent oscillation as a result of positive feedback in the audio paths.

The HWLD can be disabled by setting the AH- bit to 1 in the (MC) control register.

**Offset Null Filter**

To ensure robust performance of the adaptive filters at all times, any DC offset that may be present on either the Rin signal or the Sin signal, is removed by highpass filters. These filters have a corner frequency placed at 40Hz.

The offset null filters can be disabled by setting the HPF- bit to 1 in the LEC or AEC control registers.

**Limiters**

To prevent clipping in the echo paths, two limiters with variable thresholds are provided at the outputs.

The Rout limiter threshold is in Rout Limiter Register 1 and 2. The Sout limiter threshold is in Sout Limiter Register. Both output limiters are always enabled.

**User Gain**

The user gain function provides the ability for users to adjust the audio gain in the receive path (speaker path). This gain is adjustable from -24dB to +21dB in 3dB steps. It is important to use ONLY this user gain function to adjust the speaker volume. The user gain function in the MT9315 is optimally placed between the two echo cancellers such that no reconvergence is necessary after gain changes.

The gain can be accessed through Receive Gain Control Register.

**AGC**

The AGC function is provided to limit the volume in the speaker path. The gain of the speaker path is automatically reduced during the following conditions:

- When clipping of the receive signal occurs.
- When initial convergence of the acoustic echo canceller detects unusually large echo return.
- When howling is detected.

The AGC can be disabled by setting the AGC- bit to 1 in MC control register.

**Mute Function**

A pcm mute function is provided for independent control of the Receive and Send audio paths. Setting the MUTE\_R or MUTE\_S bit in the MC register, causes quiet code to be transmitted on the Rout or Sout paths respectively.

Quiet code is defined according to the following table.

	LINEAR 16 bits 2's complement	SIGN/ MAGNITUDE μ-Law A-Law	CCITT (G.711)	
			μ-Law	A-Law
+Zero (quiet code)	0000h	80h	FFh	D5h

**Table 1 - Quiet PCM Code Assignment**

**Bypass Control**

A PCM bypass function is provided to allow transparent transmission of pcm data through the MT9315. When the bypass function is active, pcm data passes transparently from Rin to Rout and from Sin to Sout, with bit-wise integrity preserved.

When the Bypass function is selected, most internal functions are powered down to provide low power consumption.

The BYPASS control bit is located in the main control MC register.

**Adaptation Enable/Disable**

Adaptation control bits are located in the AEC and LEC control registers. When the ADAPT- bit is set to 1, the adaptive filter is frozen at the current state. In this state, the device continues to cancel echo with the current echo model.

When the ADAPT- bit is set to 0, the adaptive filter is continually updated. This allows the echo canceller to adapt and track changes in the echo path. This is the normal operating state.

**MT9315 Throughput Delay**

In all modes, voice channels always have 2 frames of delay. In ST-BUS operation, the D and C channels have a delay of one frame.

**Power Down**

Forcing the  $\overline{\text{PWRDN}}$  pin to logic low, will put the MT9315 into a power down state. In this state all internal clocks are halted, the DATA1, Sout and Rout pins are tristated.

The user should hold the  $\overline{\text{PWRDN}}$  pin low for 200 msec on Power-up. This will insure that the device powers up in a proper state.

The device will automatically begin the execution of initialization routines when the  $\overline{\text{PWRDN}}$  pin is returned to logic high and a clock is applied to the MCLK pin. The initialization routines execute for one frame and will set the MT9315 to default register values.

After power down, the user waits for 2 complete 8 KHz frames prior to writing to the device registers.

**PCM Data I/O**

The PCM data transfer for the MT9315 is provided through two PCM ports. One port consists of Rin and Sout pins while the second port consists of Sin and Rout pins. The data are transferred through these ports according to either ST-BUS or SSI conventions. The device determines the convention by monitoring the signal applied to the  $\overline{\text{FOi}}$  pin. When a valid ST-BUS frame pulse is applied to the  $\overline{\text{FOi}}$  pin, the MT9315 will assume ST-BUS operation. If  $\overline{\text{FOi}}$  is tied continuously to Vss, the MT9315 will assume SSI operation.

**ST-BUS Operation**

The ST-BUS PCM interface conforms to Mitel's ST-BUS standard and it is used to transport 8 bit companded PCM data (using one timeslot) or 16 bit 2's complement linear PCM data (using two timeslots). The MD1/ENA1 pins select the timeslot on the Rin/Sout port while the MD2/ENA2 pin selects the timeslot on the Sin/Rout port. See Table 2 and Figures 3 to 6.

PORT1 Rin/Sout		ST-BUS Mode Selection	PORT2 Sin/Rout	
Enable Pins			Enable Pins	
MD1	ENA1		MD2	ENA2
0	0	Mode 1. 8 bit companded PCM I/O on timeslot 0	0	0
0	1	Mode 2. 8 bit companded PCM I/O on timeslot 2.	0	1
1	0	Mode 3. 8 bit companded PCM I/O on timeslot 2. Includes D & C channel bypass in timeslots 0 & 1.	1	0
1	1	Mode 4. 16 bit 2's complement linear PCM I/O on timeslots 0 & 1.	1	1

**Table 2 - ST-BUS Mode Select**

**SSI Operation**

The SSI PCM interface consists of data input pins (Rin, Sin), data output pins (Sout, Rout), a variable rate bit clock (BCLK), and two enable pins (ENA1, ENA2) to provide strobes for data transfers. The active high enable may be either 8 or 16 BCLK cycles in duration. Automatic detection of the data type (8 bit companded or 16 bit 2's complement linear) is accomplished internally. The data type cannot change dynamically from one frame to the next.

In SSI operation, the frame boundary is determined by the rising edge of the ENA1 enable strobe (see Figure 7). The other enable strobe (ENA2) is used for parsing input/output data and it must pulse within 125 microseconds of the rising edge of ENA1.

In SSI operation, the enable strobes may be a mixed combination of 8 or 16 BCLK cycles allowing the flexibility to mix 2's complement linear data on one port (e.g., Rin/Sout) with companded data on the other port (e.g., Sin/Rout).

Enable Strobe Pin	Designated PCM I/O Port
ENA1	Line Side Echo Path (PORT 1)
ENA2	Acoustic Side Echo Path (PORT 2)

**Table 3 - SSI Enable Strobe Pins**

**PCM Law and Format Control (LAW, FORMAT)**

The PCM companding/coding law used by the MT9315 is controlled through the LAW and FORMAT pins. ITU-T G.711 companding curves for  $\mu$ -Law and A-Law are selected by the LAW pin. PCM coding ITU-T G.711 and Sign-Magnitude are selected by the FORMAT pin. See Table 4.

PCM Code	Sign-Magnitude	ITU-T (G.711)	
	FORMAT=0	FORMAT=1	
	$\mu$ /A-LAW LAW = 0 or 1	$\mu$ -LAW LAW = 0	A-LAW LAW = 1
+ Full Scale	1111 1111	1000 0000	1010 1010
+ Zero	1000 0000	1111 1111	1101 0101
- Zero	0000 0000	0111 1111	0101 0101
- Full Scale	0111 1111	0000 0000	0010 1010

Table 4 - Companded PCM

### Linear PCM

The 16-bit 2's complement PCM linear coding permits a dynamic range beyond that which is specified in ITU-T G.711 for companded PCM. The echo-cancellation algorithm will accept 16 bits 2's complement linear code which gives a maximum signal level of +15dBm0.

### Bit Clock (BCLK/C4i)

The BCLK/ $\overline{C4i}$  pin is used to clock the PCM data in both SSI (BCLK) and ST-BUS ( $\overline{C4i}$ ) operations.

In SSI operation, the bit rate is determined by the BCLK frequency. This input must contain either eight or sixteen clock cycles within the valid enable strobe window. BCLK may be any rate between 128 KHz to 4.096 MHz and can be discontinuous outside of the enable strobe windows defined by ENA1, ENA2 pins. Incoming PCM data (Rin, Sin) are sampled on the falling edge of BCLK while outgoing PCM data (Sout, Rout) are clocked out on the rising edge of BCLK. See Figure 11.

In ST-BUS operation, connect the system  $\overline{C4}$  (4.096MHz) clock to the  $\overline{C4i}$  pin.

### Master Clock (MCLK)

A nominal 20MHz master clock (MCLK) is required. The MCLK input may be asynchronous with the 8KHz frame.

### Microport

The serial microport provides access to all MT9315 internal read and write registers. This microport is compatible with Intel MCS-51 (mode 0), Motorola SPI (CPOL=0, CPHA=0), and National Semiconductor Microwire specifications. The

microport consists of a transmit/receive data pin (DATA1), a receive data pin (DATA2), a chip select pin ( $\overline{CS}$ ) and a synchronous data clock pin (SCLK).

The MT9315 automatically adjusts its internal timing and pin configuration to conform to Intel or Motorola/National requirements. The microport dynamically senses the state of the SCLK pin each time  $\overline{CS}$  pin becomes active (i.e. high to low transition). If SCLK pin is high during  $\overline{CS}$  activation, then Intel mode 0 timing is assumed. In this case DATA1 pin is defined as a bi-directional (transmit/receive) serial port and DATA2 is internally disconnected. If SCLK is low during  $\overline{CS}$  activation, then Motorola/National timing is assumed and DATA1 is defined as the data transmit pin while DATA2 becomes the data receive pin. The MT9315 supports Motorola half-duplex processor mode (CPOL=0 and CPHA=0). This means that during a write to the MT9315, by the Motorola processor, output data from the DATA1 pin must be ignored. This also means that input data on the DATA2 pin is ignored by the MT9315 during a valid read by the Motorola processor.

All data transfers through the microport are two bytes long. This requires the transmission of a Command/Address byte followed by the data byte to be written to or read from the addressed register.  $\overline{CS}$  must remain low for the duration of this two-byte transfer. As shown in Figures 8 and 9, the falling edge of  $\overline{CS}$  indicates to the MT9315 that a microport transfer is about to begin. The first 8 clock cycles of SCLK after the falling edge of  $\overline{CS}$  are always used to receive the Command/Address byte from the microcontroller. The Command/Address byte contains information detailing whether the second byte transfer will be a read or a write operation and at what address. The next 8 clock cycles are used to transfer the data byte between the MT9315 and the microcontroller. At the end of the two-byte transfer,  $\overline{CS}$  is brought high again to terminate the session. The rising edge of  $\overline{CS}$  will tri-state the DATA1 pin. The DATA1 pin will remain tri-stated as long as  $\overline{CS}$  is high.

Intel processors utilize Least Significant Bit (LSB) first transmission while Motorola/National processors use Most Significant Bit (MSB) first transmission. The MT9315 microport automatically accommodates these two schemes for normal data bytes. However, to ensure timely decoding of the R/W and address information, the Command/Address byte is defined differently for Intel and Motorola/National operations. Refer to the relative timing diagrams of Figure 8 and Figure 9.

Receive data bits are sampled on the rising edge of SCLK while transmit data is clocked out on the falling edge of SCLK. Detailed microport timing is shown in Figure 13 and Figure 14.

Figure 3 - ST-BUS 8 Bit Companded PCM I/O on Timeslot 0 (Mode 1)

## Register Summary

Address: 00h R/W	<b>Main Control Register (MC)</b>									
Power Up Reset 00h	7	6	5	4	3	2	1	0		
	MSB	LIMIT	MUTE_R	MUTE_S	BYPASS	NB-	AGC-	AH-	RESET	LSB
<b>RESET</b>	When high, the power initialization routine is executed presetting all registers to default values. This bit automatically clears itself to '0' when reset is complete.									
<b>AH-</b>	When high, the Howling detector is disabled and when low the Howling detector is enabled.									
<b>AGC-</b>	When high, AGC is disabled and when low AGC is enabled									
<b>NB-</b>	When high, Narrowband signal detectors in Rin and Sin paths are disabled and when low the signal detectors are enabled									
<b>BYPASS</b>	When high, the Send and Receive paths are transparently by-passed from input to output and when low the Send and Receive paths are not bypassed									
<b>MUTE_S</b>	When high, the Sin path is muted to quite code (after the NLP) and when low the Sin path is not muted									
<b>MUTE_R</b>	When high, the Rin path is muted to quite code (after the NLP) and when low the Rin path is not muted									
<b>LIMIT</b>	When high, the 2-bit shift mode is enabled in conjunction with bit 7 of LEC register and when low 2-bit shift mode is disabled									

Address: 21h R/W	<b>Acoustic Echo Canceller Control Register (AEC)</b>									
Power Up Reset 00h	7	6	5	4	3	2	1	0		
	MSB	P-	ASC-	NLP-	INJ-	HPF-	HCLR	ADAPT-	ECBY	LSB
<b>ECBY</b>	When high, the Echo estimate from the filter is not subtracted from the Send path, when low the estimate is subtracted									
<b>ADAPT-</b>	When high, the Echo canceller adaptation is disabled and when low the adaptation is enabled									
<b>HCLR</b>	When high, Adaptive filter coefficients are cleared and when low the filter coefficients are not cleared									
<b>HPF-</b>	When high, Offset nulling filter is bypassed in the Sin/Sout path and when low the Offset nulling filter in not bypassed									
<b>INJ-</b>	When high, the Noise filtering process is disabled in the NLP and when low the Noise filtering process is enabled									
<b>NLP-</b>	When high, the Non Linear Processor is disabled in the Sin/Sout path and when low the NLP is enabled									
<b>ASC-</b>	When high, the Internal Adaptation speed control is disabled and when low the Adaptation speed is enabled									
<b>P-</b>	When high, the Exponential weighting function for the adaptive filter is disabled and when low the weighting function is enabled									

Address: 01h R/W	<b>Line Echo Canceller Control Register (LEC)</b>									
Power Up Reset 00h	7	6	5	4	3	2	1	0		
	MSB	SHFT	ASC-	NLP-	INJ-	HPF-	HCLR	ADAPT-	ECBY	LSB
<b>ECBY</b>	When high, the Echo estimate from the filter is not subtracted from the Send path, when low the estimate is subtracted									
<b>ADAPT-</b>	When high, the Echo canceller adaptation is disabled and when low the adaptation is enabled									
<b>HCLR</b>	When high, Adaptive filter coefficients are cleared and when low the filter coefficients are not cleared									
<b>HPF-</b>	When high, Offset nulling filter is bypassed in the Rin/Rout path and when low the Offset nulling filter in not bypassed									
<b>INJ-</b>	When high, the Noise filtering process is disabled in the NLP and when low the Noise filtering process is enabled									
<b>NLP-</b>	When high, the Non Linear Processor is disabled in the Rin/Rout path and when low the NLP is enabled									
<b>ASC-</b>	When high, the Internal Adaptation speed control is disabled and when low the Adaptation speed is enabled									
<b>SHFT</b>	when high the 16-bit linear mode, inputs Sin, Rin, are shift right by 2 and outputs Sout, Rout are shift left by 2. This bit is ignored when 16-bit linear mode is not selected in both ports. This bit is also ignored if bit 7 of MC register is set to zero									

Address: 22h Read	<b>Acoustic Echo Canceller Status Register (ASR)</b> (* Do not write to this register)																
Power Up Reset 00h	7	-	6	ACMUND	5	HWLNG	4	-	3	NLPDC	2	DT	1	NB	0	NBS	LSB
<b>NBS</b>	When high, the Narrowband signal has been detected in the Sin/Sout path and when low, the Narrowband signal has not been detected in the Sin/Sout path																
<b>NB</b>	LOGICAL OR of the status bit NBS + NBR from LSR Register																
<b>DT</b>	When high the Double Talk is detected and when low, the Double talk is not detected																
<b>NLPDC</b>	When high, the NLP is activated and when low the NLP is not activated																
-	RESERVED.																
<b>HWLNG</b>	When high, Howling is occurring in the loop and when low, no Howling is detected																
<b>ACMUND</b>	When high, No active signal in the Rin/Rout path																
-	RESERVED.																

Address: 02h Read	<b>Line Echo Canceller Status Register (LSR)</b> (* Do not write to this register)																
Power Up Reset 00h	7	-	6	-	5	-	4	-	3	NLPC	2	DT	1	NB	0	NBR	LSB
<b>NBR</b>	When high, a narrowband signal has been detected in the Receive (Rin) path. When low no narrowband signal is not detected in the Rin path																
<b>NB</b>	This bit indicates a LOGICAL-OR of Status bits NBR + NBS ( from ASR Register)																
<b>DT</b>	When high, double-talk is detected and when low double-talk is not detected																
<b>NLPC</b>	When high, NLP is activated and when low NLP is not activated																
-	RESERVED.

Information relating to products and services furnished herein by Zarlink Semiconductor Inc. trading as Zarlink Semiconductor or its subsidiaries (collectively "Zarlink") is believed to be reliable. However, Zarlink assumes no liability for errors that may appear in this publication, or for liability otherwise arising from the application or use of any such information, product or service or for any infringement of patents or other intellectual property rights owned by third parties which may result from such application or use. Neither the supply of such information or purchase of product or service conveys any license, either express or implied, under patents or other intellectual property rights owned by Zarlink or licensed from third parties by Zarlink, whatsoever. Purchasers of products are also hereby notified that the use of product in certain ways or in combination with Zarlink, or non-Zarlink furnished goods or services may infringe patents or other intellectual property rights owned by Zarlink.

This publication is issued to provide information only and (unless agreed by Zarlink in writing) may not be used, applied or reproduced for any purpose nor form part of any order or contract nor to be regarded as a representation relating to the products or services concerned. The products, their specifications, services and other information appearing in this publication are subject to change by Zarlink without notice. No warranty or guarantee express or implied is made regarding the capability, performance or suitability of any product or service. Information concerning possible methods of use is provided as a guide only and does not constitute any guarantee that such methods of use will be satisfactory in a specific piece of equipment. It is the user's responsibility to fully determine the performance and suitability of any equipment using such information and to ensure that any publication or data used is up to date and has not been superseded. Manufacturing does not necessarily include testing of all functions or parameters. These products are not suitable for use in any medical products whose failure to perform may result in significant injury or death to the user. All products and materials are sold and services provided subject to Zarlink's conditions of sale which are available on request.

Purchase of Zarlink's I<sup>2</sup>C components conveys a licence under the Philips I<sup>2</sup>C Patent rights to use these components in an I<sup>2</sup>C System, provided that the system conforms to the I<sup>2</sup>C Standard Specification as defined by Philips.
