## FUNCTION DESCRIPTION

An information word consists of 4 periods as illustrated below.

Composition of information

### Address/Data waveform

SM5212E begin a 4-word transmission cycle upon receipt of a transmission enable (TE active low). This cycle will repeat itself as long as the transmission enable (TE is held low). Once the transmission enable returns high the encoder output completes its final cycle and then stops as shown below.

## 2. OSC Frequency

SM5212E's oscillator can be constructed by connecting a resistor between OSC1 and OSC2 pin.

Encoder OSC Frequency

The recommended oscillator frequency is  $F_{OSC D}$  (SM5212D decoder) = 8 - 10  $F_{OSC D}$  (SM5212E encoder)
