CMOS 8-Bit Microcontroller

TMP88PU77F

The 88PU77 are the high-speed and high performance 8-bit single chip microcomputers which built in a program storage area (96 Kbyte) and the One-Time PROM of bector table storage area (256 byte). The 88PU77 is pin compatible with the 88CP77/S77/U77. The operations possible with the 88PU77 can be performed by writing programs to PROM. The 88PU77 can write and verify in the same way as the TC571000 an EPROM programmer.

- For a discussion of how the reliability of microcontrollers can be predicted, please refer to Section 1.3 of the chapter entitled Quality and Reliability Assurance / Handling Precautions.
- TOSHIBA is continually working to improve the quality and reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to comply with the standards of safety in making a safe design for the entire system, and to avoid situations in which a malfunction or failure of such TOSHIBA products could cause loss of human life, bodily injury or damage to property.
  In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent TOSHIBA products specifications. Also, please keep in mind the precautions and conditions set forth in the "Handling Guide for Semiconductor Devices," or "TOSHIBA Semiconductor Reliability Handbook" etc..
- The TOSHIBA products listed in this document are intended for usage in general electronics applications (computer, personal equipment, office equipment, measuring equipment, industrial robotics, domestic appliances, etc.). These TOSHIBA products are neither intended nor warranted for usage in equipment that requires extraordinarily high quality and/or reliability or a malfunction or failure of which may cause loss of human life or bodily injury ("Unintended Usage"). Unintended Usage include atomic energy control instruments, airplane or spaceship instruments, transportation instruments, traffic signal instruments, combustion control instruments, medical instruments, all types of safety devices, etc.. Unintended Usage of TOSHIBA products listed in this document shall be made at the customer's own risk.
- The products described in this document are subject to the foreign exchange and foreign trade laws.

Pin Function

The 88PU77 has two modes: MCU and PROM.

(1) MCU mode
In this mode, the 88PU77 is pin compatible with the 88CP77/S77/U77 (fix the TEST pin at low level).

(2) PROM mode

Pin Name (PROM mode)	Input/Output	Functions	Pin Name (MCU mode)
A16	Input	PROM address inputs	P64
A15 to A8			P63, P62, P15 to P10
A7 to A0			P47 to P40
D7 to D0	I/O	PROM data input/outputs	P53 to P51, P04 to P00
$\overline{CE}$	Input	Chip enable signal input (active low)	P16
$\overline{OE}$		Output enable signal input (active low)	P17
$\overline{PGM}$		Program mode single input	P50
VPP	Power supply	+ 12.75 V / 5 V (Program supply voltage)	TEST
VCC		+ 6.25 V / 5 V	VDD
GND		0 V	VSS
P07 to P05	Input	Pull-up with resistance for input processing

Operational Description

The configuration and functions of the 88PU77 are the same as those of the 88CP77/S77/U77, except in that a one-time PROM is used instead of an on-chip mask ROM.

1. Operating Mode

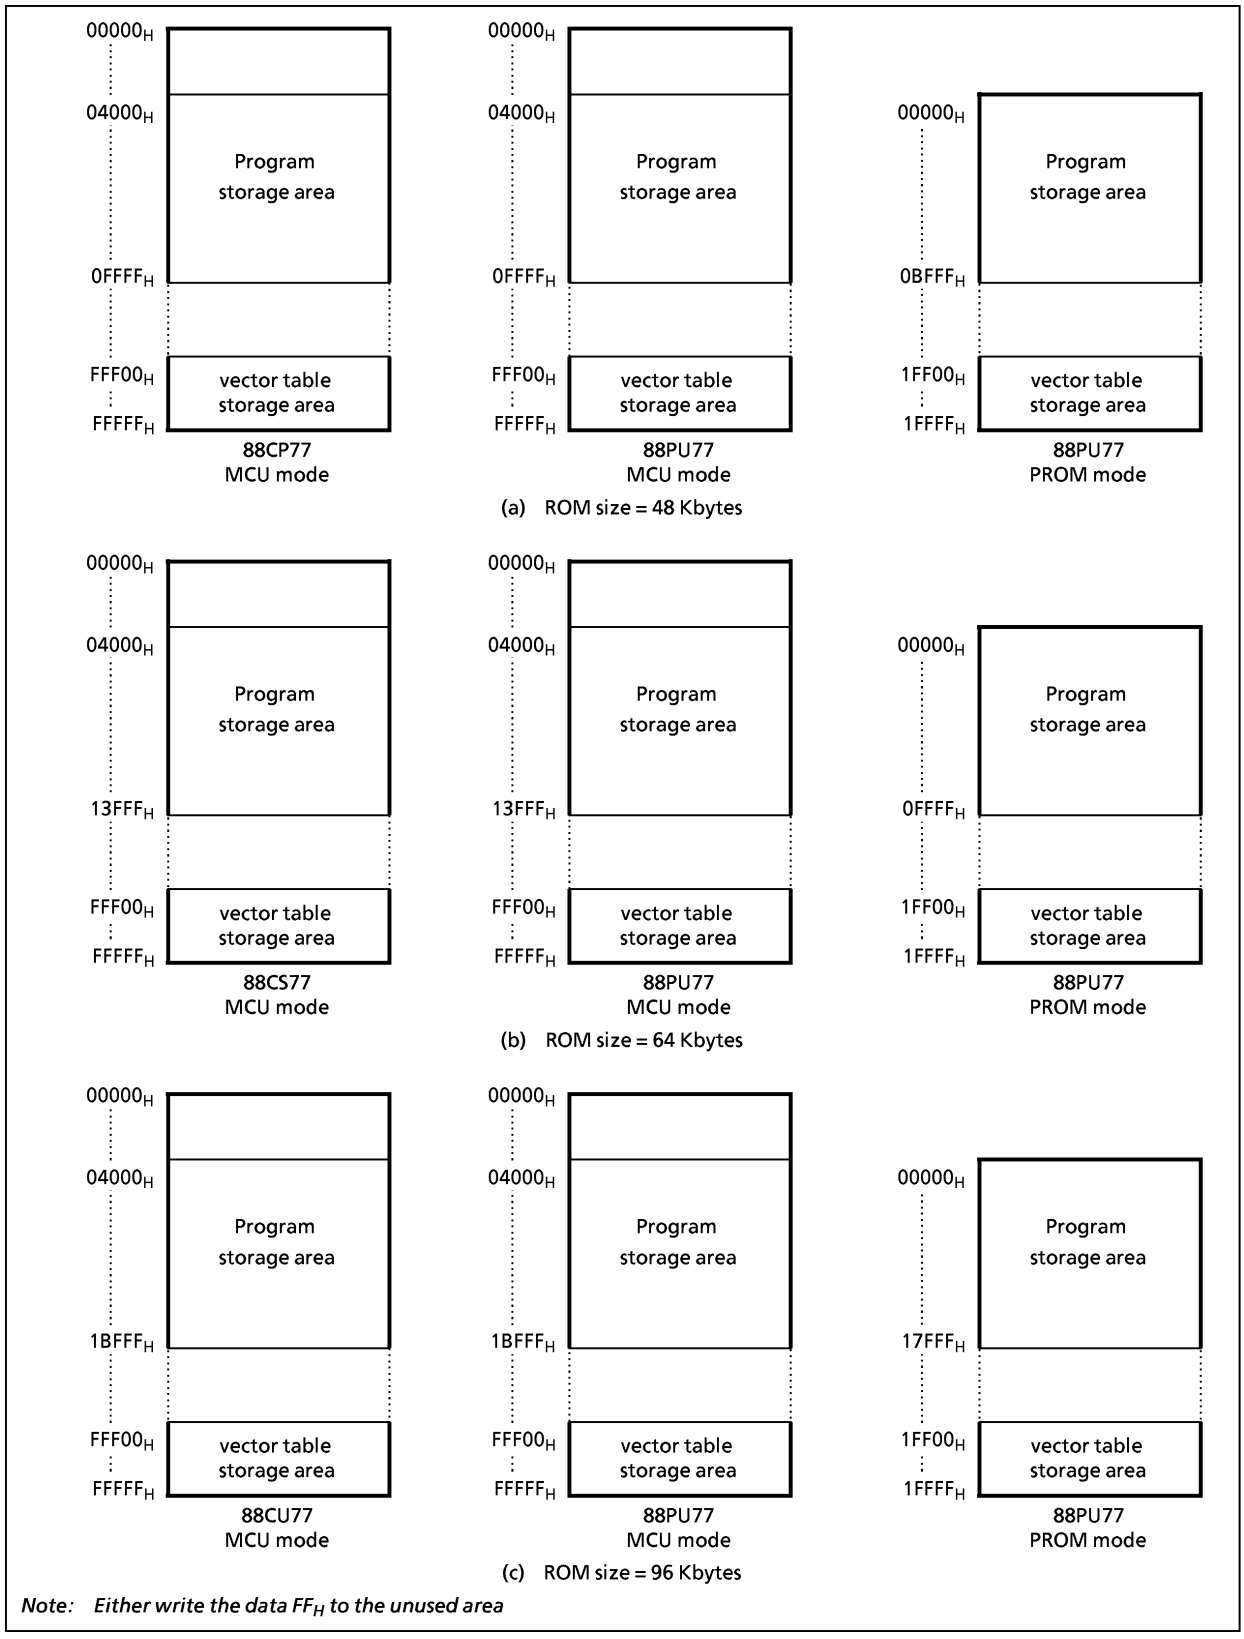
The 88PU77 has two modes: MCU and PROM.

1.1 MCU Mode

The MCU mode is activated by fixing the TEST / VPP pin at low level.
In the MCU mode, operation is the same as with the 88CP77/S77/U77 (the TEST / VPP pin cannot be used open because it has no built-in pull-down resistance).

1.1.1 Program memory

The 88PU77 has a 96 Kbyte (addresses 04000_H to $1BFFF_H$ in the MCU mode, addresses 00000_H to $17FFF_H$ in the PROM mode) of program storage area and 256 byte (addresses FFF00 to $FFFFF_H$ in the MCU mode, addresses 1FF00 to $1FFFF_H$ in the PROM mode) one-time PROM of vector table storage area.



Note: Either write the data FF_H to the unused area

Storage Temperature	Tstg		– 55 to 125	°C
Operating Temperature	Topr		– 30 to 70	°C

Note 1: The absolute maximum ratings are rated values which must not be exceeded during operation, even for an instant. Any one of the ratings must not be exceeded. If any absolute maximum rating is exceeded, a device may break down or its performance may be degraded, causing it to catch fire or explode resulting in injury to the user. Thus, when designing products which include this device, ensure that no absolute maximum rating value will ever be exceeded.

Note 2: Power Dissipation (PD) ; For PD, it is necessary to decrease -14.3 mW/°C. (Refernce to TMP88CP77/S77/U77)

Note 3: All VDDs should be connected externally for keeping the same voltage level.

Recommended Operating Conditions (V_{SS} = 0 V, Topr = – 30 to 70°C)

	fs	XTIN, XTOUT	V_{DD} = 2.7 V to 5.5 V		30.0	34.0	kHz

Note: The recommended operating conditions for a device are operating conditions under which it can be guaranteed that the device will operate as specified. If the device is used under operating conditions other than the recommended operating conditions (supply voltage, operating temperature range, specified AC/DC values etc.), malfunction may occur. Thus, when designing products which include this device, ensure that the recommended operating conditions for the device are always adhered to.

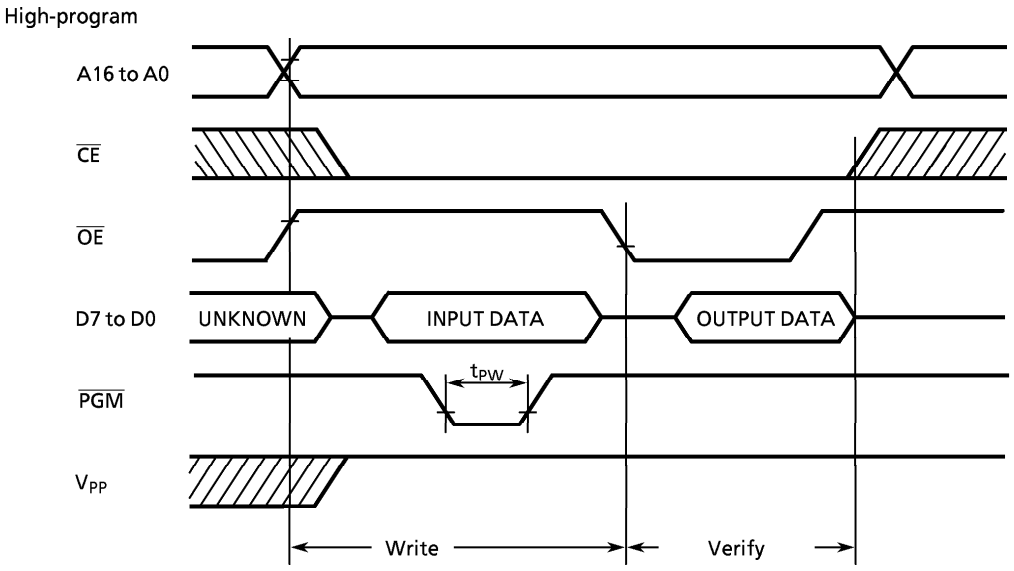
Initial Program Pulse Width	t_{PW}	V_{DD} = 6.0 V	0.095	0.1	0.105	ms



Note1: When V_{cc} power supply is turned on or after, V_{pp} must be increased.
When V_{cc} power supply is turned off or before, V_{pp} must be decreased.
Note2: The device must not be set to the EPROM programmer or picked up from it under applying the program voltage (12.75 V ± 0.5 V) to the V_{pp} pin as the device is damaged.
Note3: Be sure to execute the recommended programing mode with the recommended programing adaptor. If a mode or an adaptor except the above, the misoperation sometimes occurs.
