Triple/Dual-Mode CDMA LNA/Mixers

MAX2323/MAX2325

General Description

The MAX2323/MAX2325 are low-noise amplifier (LNA) plus mixer ICs optimized for code-division multiple-access (CDMA) applications in both cellular and PCS bands. The MAX2323 addresses dual-band, triple-mode CDMA applications by providing switched signal paths for cellular FM, cellular CDMA, and PCS CDMA. The MAX2325 is a cellular-band dual-mode version.

To optimize cellular-band dynamic range at minimum current, the MAX2323/MAX2325 implement four LNA states: high gain/high linearity, high gain/low linearity, midgain, and low gain. In high-gain/high-linearity mode, the adjustable high-intercept LNA minimizes desensitization in the presence of a large interfering signal. For the other gain states, the LNA current is reduced to improve stand-by time.

The CDMA mixers are designed for high linearity, low noise, and differential IF outputs, while the FM mixer is designed for lower current and single-ended output. Each band is implemented with a separate mixer to optimize performance for the specific band.

The MAX2323/MAX2325 can also be used in TDMA, EDGE, and W-CDMA phones.

Note 1: Devices are production tested for functionality at frequencies stated; 30 units from 3 independent wafer lots, when one lot was at the upper process extreme, one lot was nominal, and one lot was at the lower process extreme, were characterized. The resulting standard deviation therefore includes process variations. Data sheet limits are $\pm 3\sigma$ from the mean.

Note 2: Operation over this frequency range requires the ports to be rematched for the desired operating range. Performance at various frequencies is indicated by the S-parameter data in Tables 3–7.

Note 3: Specifications are based on $R_{BIAS} = 20\text{k}\Omega$. I_{CC} for all LNAs (except HGHL) and mixers are inversely proportional to R_{BIAS} . IIP3 can be traded for I_{CC} by selecting other values of R_{BIAS} .
