DS07-13505-5E

# 16-bit Proprietary Microcontroller

# F<sup>2</sup>MC-16F MB90246A Series

# MB90246A

### **■ DESCRIPTION**

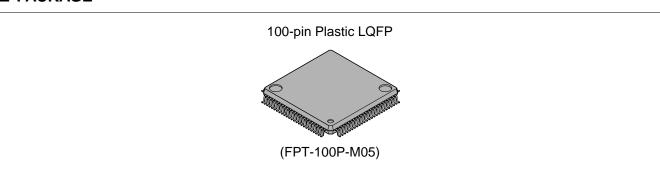

The MB90246A series is a 16-bit microcontroller optimum to control mechatronics such as a hard disk drive unit.

The instruction set of F<sup>2</sup>MC-16F CPU core inherits AT architecture of F<sup>2</sup>MC\*-16/16H family with additional instruction sets for high-level languages, extended addressing mode, enhanced multiplication/division instructions, and enhanced bit manipulation instructions. The microcontroller has a 32-bit accumulator for processing long word data (32-bit).

The MB90246A series contains a production addition unit as peripheral resources for enabling easy implementation of functions supported by IIR and FIR digital filters. It also supports a wealth of peripheral functions including:

- an 8/10-bit A/D converter having eight channels;
- an 8-bit D/A converter having three channels;
- UART;
- an 8-bit PWM timer having four channels;
- a timer having three plus one channels;
- an input capture (ICU) having two channels; and
- a DTP/external interrupt circuit having four channels.
- \*: F2MC stands for FUJITSU Flexible Microcontroller.

#### ■ PACKAGE

### **■ FEATURES**

Clock

Operating clock can be selected from divided-by-2, 4, 8 or 32 of oscillation (at oscillation of 32 MHz, 1 MHz to 16 MHz).

Minimum instruction execution time of 62.5 ns (at machine clock of 16 MHz)

• CPU addressing space of 16 Mbytes

Internal addressing of 24-bit

External accessing can be performed by selecting 8/16-bit bus width (external bus mode)

Instruction set optimized for controller applications

Rich data types (bit, byte, word, long word)

Rich addressing mode (23 types)

High code efficiency

Enhanced precision calculation realized by the 32-bit accumulator

Signed multiplication/division instruction

• Instruction set designed for high level language (C) and multi-task operations

Adoption of system stack pointer

Enhanced pointer indirect instructions

Barrel shift instructions

Enhanced execution speed

8-byte instruction queue

• Enhanced interrupt function

Priority levels: 8 levels

External interrupt input ports: 4 ports

• Automatic data transmission function independent of CPU operation

Extended intelligent I/O service function (EI2OS)

• Low-power consumption (stand-by) mode

Sleep mode (mode in which CPU operating clock is stopped)

Stop mode (mode in which oscillation is stopped)

Hardware stand-by mode

Gear function

Process

CMOS technology

• I/O port

General-purpose I/O ports (CMOS): 38 General-purpose I/O ports (TTL): 11

General-purpose I/O ports (N-ch open-drain): 8

Total: 57
• Timer

Timebase timer/watchdog timer: 1 channel

8-bit PWM timer: 4 channels 16-bit re-load timer: 3 channels

• 16-bit I/O timer

16-bit free-run timer: 1 channel Input capture (ICU): 2 channels

• I/O simple serial interface

Clock synchronized transmission can be used.

UART: 1 channel

Clock asynchronized or clock synchronized serial transmission can be selectively used.

• DTP/external interrupt circuit: 4 channels

A module for starting extended intelligent I/O service (EI<sup>2</sup>OS) and generating an external interrupt triggered by an external input.

### (Continued)

- Delayed interrupt generation module
   Generates an interrupt request for switching tasks.
- 8/10-bit A/D converter: 8 channels
   8-bit or 10-bit resolution can be selectively used.
   Starting by an external trigger input.
- 8-bit D/A converter

Resolution: 8 bits × 3 channels

• DSP interface for the IIR filter

Function dedicated to IIR calculation

Up to eight items of results of signed multiplication of  $16 \times 16$  bits are added.

Execution time of Yk = 
$$\frac{N}{n}$$
 bn Yk -  $\frac{M}{n}$  +  $\frac{M}{n}$  am Xk - m: 0.625  $\mu$ s (When oscillation is 32 MHz and when N = M =3) m = 0

Up to three N and M values can be set at your disposal.

# **■ PRODUCT LINEUP**

Part number		MB90246A	MB90V246			
Item		III 302 TOA	IND304240			
Classification		Mass-produced product	Evaluation product			
ROM size		No	ne			
RAM size		4 k × 8 bits	6 k × 8 bits			
CPU funct	ions	The number of instructions: 412 Instruction bit length: 8 bits, 16 bits Instruction length: 1 byte to 7 bytes Data bit length: 1 bit, 4 bits, 8 bits, 16 bits, 32 bits Minimum execution time: 62.5 ns (at machine clock of 16 MHz) Interrupt processing time: 1.0 µs (at machine clock of 16 MHz, minimum value)				
Ports		General-purpose I/O ports (CMOS output): 38 General-purpose I/O ports (TTL input): 11 General-purpose I/O ports (N-ch open-drain output): 8 Total: 57				
Timebase	timer	18-bit counter Interrupt interval: 0.256 ms, 1.024 ms, 4.096 ms, 16.384 ms (at oscillation of 32 MHz)				
Watchdog	timer	Reset generation interval: 3.58 ms, 14.33 ms, 28.67 ms, 57.34 ms (at oscillation of 32 MHz, minimum value)				
8/16-bit P\	VM timer	Number of channels: 4 Pulse interval: 0.25 μs to 32.77 ms (at oscillation of 32 MHz)				
16-bit re-lo	oad timer	Number of channels: 3 16-bit re-load timer operation Interval: 125 ns to 131 ms (at machine clock of 16 MHz) External event count can be performed.				
16-bit	16-bit free-run timer	Number of channel: 1 Overflow interrupts or intermediate bit interrupts may be generated.				
I/O timer	Input capture (ICU)	Number of channel: 2 Rewriting a register value upon a pin input (rising, falling, or both edges)				
I/O simple	serial interface	Number of channels: 2 Clock synchronized transmission (62.5 kbps to 8 Mbps)				
UART		Clock asynchronized transmission (2404 bps to 500 kbps) Clock synchronized transmission (250 kbps to 2 Mbps) Transmission can be performed by bi-directional serial transmission or by master/slave connection.				
DTP/external interrupt circuit		Number of inputs: 4 Started by a rising edge, a falling edge, an "H" level input, or an "L" level input. External interrupt circuit or extended intelligent I/O service (El <sup>2</sup> OS) can be used.				
Delayed in module	terrupt generation	An interrupt generation module for switching tasks used in real-time operating systems.				

### (Continued)

Part number	MB90246A	MB90V246	
8/10-bit A/D converter	Conversion precision: 10-bit or 8-bit can be selectively used.  Number of inputs: 8  One-shot conversion mode (converts selected channel only once)  Continuous conversion mode (converts selected channel continuously)  Stop conversion mode (converts selected channel and stop operation repeatedly)		
8-bit D/A converter	Number of channels: 3 Resolution: 8 bits Based on the R-2R system		
DSP interface for the IIR filter	Function dedicated to IIR calculation Up to 8 items of results of signed multiplication of $16 \times 16$ bits are added. $ \begin{array}{ccccccccccccccccccccccccccccccccccc$		
Low-power consumption (stand-by) mode	Sleep/stop/hardware stand-by/gear function		
Process	CMOS		
Power supply voltage for operation*	4.5 V to 5.5 V		

<sup>\* :</sup> Varies with conditions such as the operating frequency. (See section "■ Electrical Characteristics.") Assurance for the MB90V246 is given only for operation with a tool at a power voltage of 4.5 V to 5.5 V, an operating temperature of 0 to 70 degrees centigrade, and an clock frequency of 1.6 MHz to 32 MHz.

Note: A 64-word RAM for product addition is supported in addition to the above RAMs.

### ■ PACKAGE AND CORRESPONDING PRODUCTS

Package	MB90246A	MB90V246
FPT-100P-M05	0	×
PGA-256C-A02	×	0

○ : Available ×: Not available

Note: For more information about each package, see section "■ Package Dimensions."

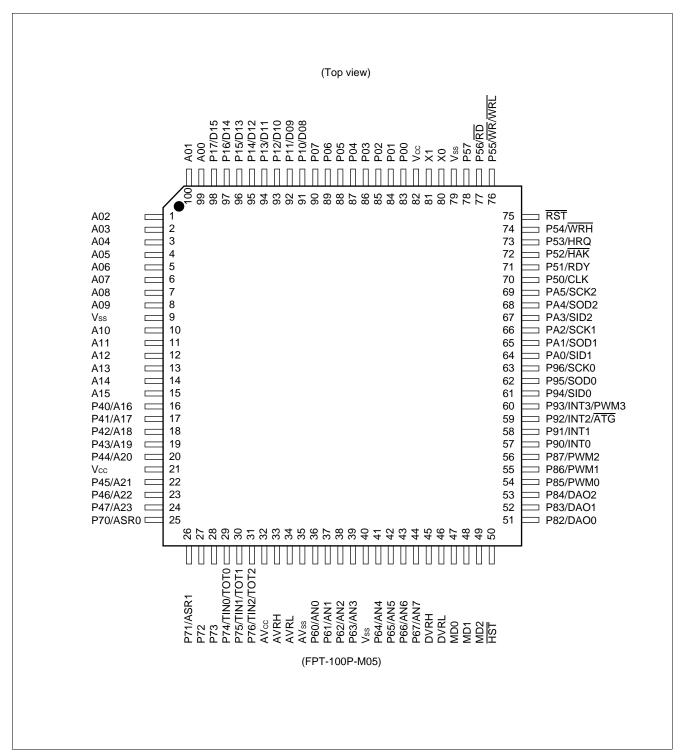

# **■ DIFFERENCES AMONG PRODUCTS**

### **Memory Size**

In evaluation with an evaluation chips, note the difference between the evaluation chip and the chip actually used.

The RAM size is 4 Kbytes for the MB90246A, and 6 Kbytes for the MB90V246.

# **■ PIN ASSIGNMENT**

# **■ PIN DESCRIPTION**

Pin no.		Circuit		
LQFP*	Pin name	type	Function	
80	X0	Α	This is a crystal oscillator pin.	
81	X1			
47 to 49	MD0 to MD2	С	This is an input pin for selecting operation modes. Connect directly to Vcc or Vss.	
75	RST	В	This is external reset request signal.	
50	HST	С	This is a hardware stand-by input pin.	
91 to 98	P10 to P17	D	This is a general-purpose I/O port. This function is valid in the 8-bit mode where the external bus is valid.	
	D08 to D15		This is an I/O pin for the upper 8-bit of the external address data bus. This function is valid in the 16-bit mode where the external bus is valid.	
16 to 20, 22 to 24	P40 to P44, P45 to P47	E	This is a general-purpose I/O port. This function becomes valid in the bit where the upper address control register is set to select a port.	
	A16 to A20, A21 to A23		This is an output pin for the upper 8-bit of the external address bus. This function is valid in the mode where the external bus is valid and the upper address control register is set to select an address.	
70			This is a general-purpose I/O port. This function becomes valid when the CLK output is disabled.	
	CLK		This is a CLK output pin. This function becomes valid when CLK output is enabled.	
71	P51	D	This is a general-purpose I/O port. This function becomes valid when the external ready function are disabled.	
	RDY		This is a ready input pin. This function becomes valid when the external ready function is enabled.	
72	P52	D	This is a general-purpose I/O port. This function becomes valid when the hold function are disabled.	
	HAK		This is a hold acknowledge output pin. This function becomes valid when the hold function is enabled.	
73	P53	D	This is a general-purpose I/O port. This function becomes valid when the hold function are disabled.	
	HRQ		This is a hold request input pin. This function becomes valid when the hold function is enabled.	
74	P54	Е	This is a general-purpose I/O port.  This function becomes valid, in the external bus 8-bit mode, or WRH pin output is disabled.	
	WRH		This is a write strobe output pin for the upper 8-bit of the data bus. This function becomes valid when the external bus 16-bit mode is selected, and WRH output pin is enabled.	

\*: FPT-100P-M05 (Continued)

Pin no.		Circuit	
LQFP*	Pin name	type	Function
76	P55	E	This is a general-purpose I/O port. This function becomes valid when WRL/WR pin output is disabled.
	WRL		This is a write strobe output pin for the lower 8-bit of data bus. This function becomes valid when WRL/WR pin output is enabled. WRL is used for holding the lower 8-bit for write strobe in 16-bit access operations, while WR is used for holding 8-bit data for write strobe in 8-bit access operations.
77	P56	E	This pin cannot be used as a general-purpose port.
	RD		This is a read strobe output pin for the data bus. This function is valid in the mode where the external bus is valid.
78, 28, 27	P57, P73, P72	E	This is a general-purpose I/O port.
36 to 39, 41 to 44	P60 to P63, P64 to P67	G	This is an I/O port of an N-ch open-drain type. When the data register is read by a read instruction other than the modify write instruction with the corresponding bit in ADER set at "0", the pin level is acquired. The value set in the data register is output to the pin as is.
	AN0 to AN3, AN4 to AN7		This is an analog input pin of the 8/10-bit A/D converter. When using this input pin, set the corresponding bit in ADER at "1". Also, set the corresponding bit in the data register at "1".
25	P70	Е	This is a general-purpose I/O port.
	ASR0		This is a data input pin for input capture 0.  Because this input is used as required when the input capture 0 is performing input operations, and it is necessary to stop outputs from other functions unless such outputs are made intentionally.
26	P71	Е	This is a general-purpose I/O port.
	ASR1		This is a data input pin of input capture 1.  Because this input is used as required when input capture 1 is performing input operations, and it is necessary to stop outputs by other functions unless such outputs are made intentionally.
29 to 31	P74 to P76	Е	This is a general-purpose I/O port. This function becomes valid when outputs from 16-bit re-load timer 0 – 2 are disabled.
	TIN0 to TIN 2		This is an input pin of 16-bit timer.  Because this input is used as required whin 16-bit timer 0 - 2 is performing input operations, and it is necessary to stop outputs by other functions unless such outputs are made intentionally.
	TOT0 to TOT2		These are output pins for 16-bit re-load timer 0 and 1. This function becomes valid when output from 16-bit re-load timer 0 – 2 are enabled.
51 to 53	P82 to P84	Н	This is a general-purpose I/O port. This function becomes valid when data output from 8-bit D/A converter 0 – 2 are disabled.
:FPT-100P	DAO0 to DAO2		This is an output pin of 8-bit D/A converter. This function becomes valid when data output from 8-bit D/A converter 0 – 2 are enabled.  (Continued)

: FPT-100P-M05 (Continued)

Pin no.	Din nome	Circuit	Function
LQFP*	Pin name	type	Function
54 to 56	P85 to P87	E	This is a general-purpose I/O port. This function becomes valid when output from PWM0 – PWM2 are disabled.
	PWM0 to PWM2		This is an output pin of 8-bit PWM timer. This function becomes valid when output from PWM0 – PWM2 are enabled.
57, 58	P90, P91	F	This is a general-purpose I/O port.
	INTO, INT1		This is a request input pin of the DTP/external interrupt circuit ch.0 and 1.  Because this input is used as required when the DTP/external interrupt circuit is performing input operations, and it is necessary to stop outputs from other functions unless such outputs are made intentionally.
59	P92	Е	This is a general-purpose I/O port.
	INT2		This is an input pin of the DTP/external interrupt circuit ch.2. Because this input is used as required when the DTP/external interrupt circuit is performing input operations, and it is necessary to stop outputs from other functions unless such outputs are made intentionally.
	ĀTG		This is a trigger input pin of the 8/10-bit A/D converter. Because this input is used as requited when the 8/10-bit A/D converter is performing input operations, and it is necessary to stop outputs by other functions unless such outputs are made intentionally.
60	P93	Е	This is a general-purpose I/O port. This function is always valid. This function becomes valid when output from PWM3 is disabled.
	INT3		This is a request input of the DTP/external interrupt circuit ch. 3.  Because this input is used as required when the DTP/external interrupt circuit is performing input operations, and it is necessary to stop outputs from other functions unless such output are made intentionally.
	PWM3		This is an output pin of 8-bit PWM timer. This function becomes valid when output from PWM3 is enabled.
61	P94	Е	This is a general-purpose I/O port. This function becomes valid when serial data output from UART is disabled.
	SID0		This is a serial data I/O pin of UART. This function becomes valid when serial data output from UART is enabled. Because this input is used as required when UART is performing input operations, and it is necessary to stop outputs by other functions unless such outputs are made intentionally.

\*: FPT-100P-M05 (Continued)

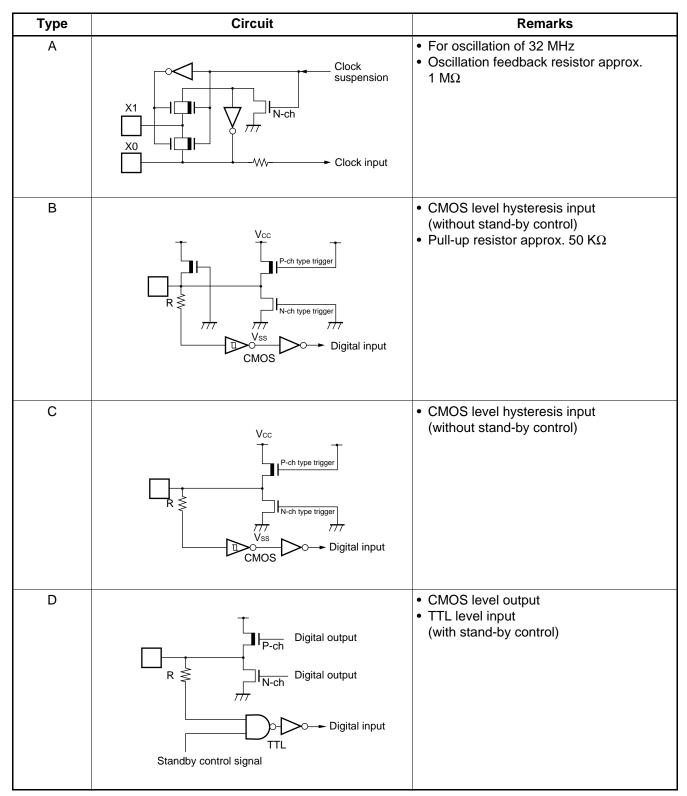

Pin no.	Din nome	Circuit	Eurofiere
LQFP*	Pin name	type	Function
62	P95	E	This is a general-purpose I/O port. This function becomes valid when data output from UART is disabled.
	SOD0		This is a data output pin of UART. This function becomes valid when data output from UART is enabled.
63	P96	E	This is a general-purpose I/O port. This function becomes valid when clock output from UART is disabled.
	SCK0		This is a clock I/O pin of UART. This function becomes valid when clock output from UART is enabled. Because this input is used as required when UART is performing input operations, and it is necessary to stop outputs by other functions unless such outputs are made intentionally.
1 to 6, 100, 99	A02 to A07, A01, A00	E	This is an output pin for the lower 8-bit of the external address bus.
7, 8, 10 to 15	A08, A09, A10 to A15	E	This is an output pin for the middle 8-bit of the external address bus. This function is valid in the mode where the external bus is valid and the middle address control refister is set to select an address.
64	PA0	Е	This is a general-purpose I/O port.
	SID1		This is a data input pin of I/O simple serial interface 1. Because this input is used as required when I/O simple serial interface 1 is performing input operations, and it is necessarey to stop outputs by other functions unless such outputs are made intentionally.
65	PA1	E	This is a general-purpose I/O port. This function becomes valid when data output from I/O simple serial interface 1 is disabled.
	SOD1		This is a data output pin of I/O simple serial interface 1. This function becomes valid when data output from I/O simple serial interface 1 is enabled.
66	PA2	E	This is a general-purpose I/O port. This function becomes valid when clock output from I/O simple serial interface 1 is disabled.
	SCK1		This is a clock output pin of I/O simple serial interface 1. This function becomes valid when clock output from I/O simple serial interface 1 is enabled.

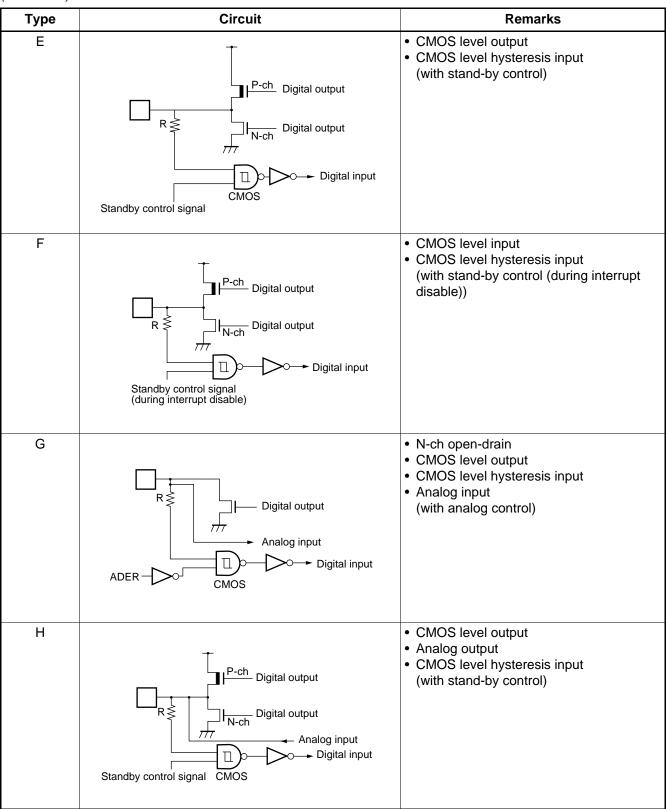

<sup>\* :</sup> FPT-100P-M05 (Continued)

Pin no.	Pin name	Circuit	Function
LQFP*	- Fin name	type	Function
67	PA3	Е	This is a general-purpose I/O port.
	SID2		This is a data input pin of I/O simple serial interface 2. Because this input is used as required when is performing input operations, and it is I/O simple serial interface 2 necessarey to stop outputs by other functions unless such outputs are made intentionally.
68	PA4	E	This is a general-purpose I/O port. This function becomes valid when data output from I/O simple serial interface 2 is disabled.
	SOD2		This is a data output pin of I/O simple serial interface 2. This function becomes valid when data output from I/O simple serial interface 2 is enabled.
69	PA5	E	This is a general-purpose I/O port. This function becomes valid when clock output from I/O simple serial interface 2 is disabled.
	SCK2		This is clock output pin of I/O simple serial interface 2. This function becomes valid when clock output from I/O simple serial interface 2 is enabled.
83 to 90	D00 to D07	D	This is an I/O pin for the lower 8-bit of the external data bus.
21, 82	Vcc	Power supply	This is power supply to the digital circuit.
9, 40, 79	Vss	Power supply	This is a ground level of the digital circuit.
32	AVcc	Power supply	This is power supply to the analog circuit.  Make sure to turn on/turn off this power supply with a voltage exceeding AVcc applied to Vcc.
33	AVRH	Power supply	This is a reference voltage input to the A/D converter.  Make sure to turn on/turn off this power supply with a voltage exceeding AVRH applied to AVcc.
34	AVRL	Power supply	This is a reference voltage input to the A/D converter.
35	AVss	Power supply	This is a ground level of the analog circuit.
45	DVRH	Power supply	This is an external reference power supply pin for the D/A converter.
46	DVRL	Power supply	This is an external reference power supply pin for the D/A converter.

<sup>\*:</sup> FPT-100P-M05

# **■ I/O CIRCUIT TYPE**

### **■ HANDLING DEVICES**

# 1. Make Sure that the Voltage not Exceed the Maximum Rating (to Avoid a Latch-up)

In CMOS ICs, a latch-up phenomenon is caused when an voltage exceeding Vcc or an voltage below Vss is applied to input or output pins or a voltage exceeding the rating is applied across Vcc and Vss.

When a latch-up is caused, the power supply current may be dramatically increased causing resultant thermal break-down of devices. To avoid the latch-up, make sure that the voltage not exceed the maximum rating.

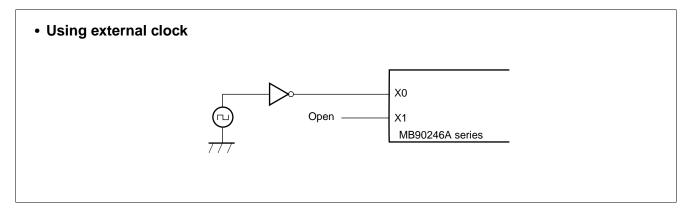

In turning on/turning off the analog power supply, make sure the analog power voltage (AVcc, AVRH) and analog input voltages not exceed the digital voltage (Vcc).

#### 2. Connection of Unused Pins

Leaving unused pins open may result in abnormal operations. Clamp the pin level by connecting it to a pull-up or a pull-down resistor.

### 3. Notes on Using External Clock

In using the external clock, drive X0 pin only and leave X1 pin unconnected.

# 4. Power Supply Pins

In products with multiple Vcc or Vss pins, the pins of a same potential are internally connected in the device to avoid abnormal operations including latch-up. However, connect the pins external power and ground lines to lower the electro-magnetic emission level and abnormal operation of strobe signals caused by the rise in the ground level, and to conform to the total current rating.

Make sure to connect Vcc and Vss pins via lowest impedance to power lines.

It is recommended to provide a bypass capacitor of around 0.1 μF between Vcc and Vss pin near the device.

### 5. Crystal Oscillator Circuit

Noises around X0 or X1 pins may be possible causes of abnormal operations. Make sure to provide bypass capacitors via shortest distance from X0, X1 pins, crystal oscillator (or ceramic resonator) and ground lines, and make sure, to the utmost effort, that lines of oscillation circuit not cross the lines of other circuits.

It is highly recommended to provide a printed circuit board art work surrounding X0 and X1 pins with an grand area for stabilizing the operation.

### 6. Turning-on Sequence of Power Supply to A/D Converter, D/A Converter and Analog Inputs

Make sure to turn on the A/D converter power supply (AVcc, AVRH, AVRL), D/A converter power supply and analog inputs (AN0 to AN7) after turning-on the digital power supply (Vcc).

Turn-off the digital power after turning off the A/D converter supply and analog inputs. In this case, make sure that the voltage not exceed AVRH or AVcc (turning on/off the analog and digital supplies simultaneously is acceptable).

#### 7. Connection of Unused Pins of A/D Converter

Connect unused pins of A/D converter to AVcc = Vcc, AVss = AVRH = AVRL = Vss.

# 8. "MOV @AL, AH", "MOVW @AL, AH" Instructions

When the above instruction is performed to I/O space, an unnecessary writing operation may be performed (#FF, #FFFF) in the internal bus.

Use the compiler function for inserting an NOP instruction before the above instructions to avoid the writing operation.

Accessing RAM space with the above instruction does not cause any problem.

#### 9. Initialization

In the device, there are internal registers which is initialized only by a power-on reset. To initialize these registers turning on the power again.

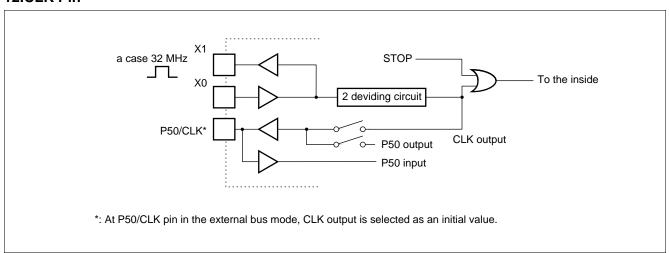

#### **10.External Reset Input**

To reset the internal securely, "L" level input to the RST pin must be at least 5 machine cycle.

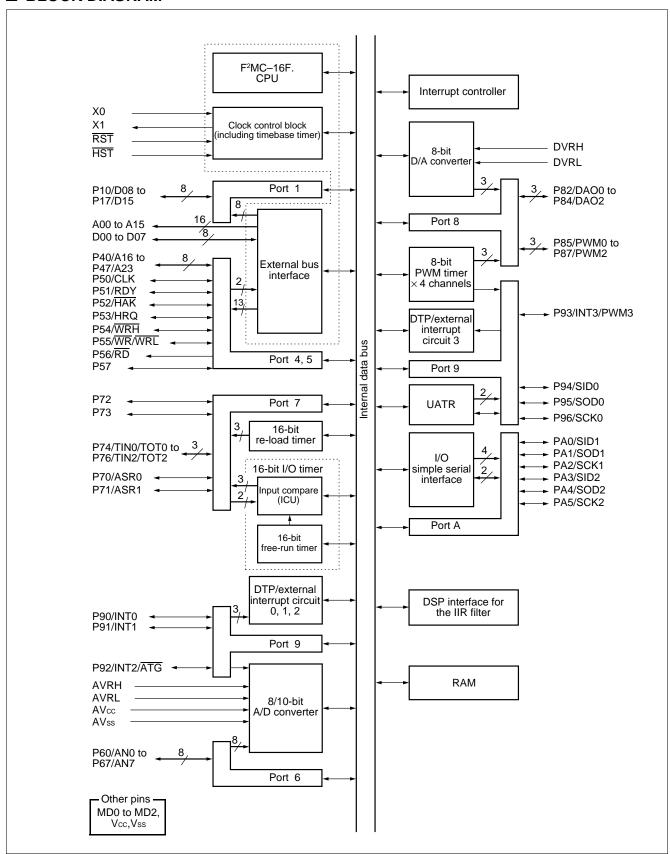

#### 11.HST Pin

Make sure  $\overline{\text{HST}}$  pin is set to "H" level when turn on the power supply. Also make sure  $\overline{\text{HST}}$  pin is never set to "L" level, when  $\overline{\text{RST}}$  pin is set to "L" level.

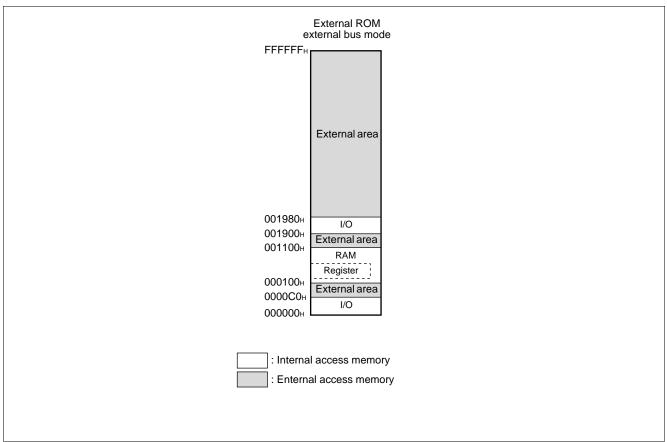

#### 12.CLK Pin

# **■ BLOCK DIAGRAM**

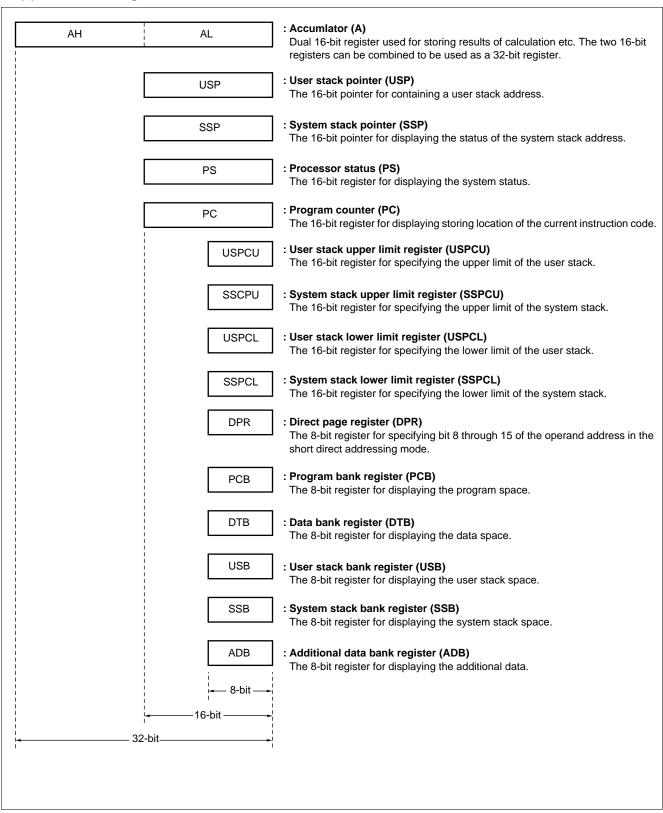

### **MEMORY MAP**

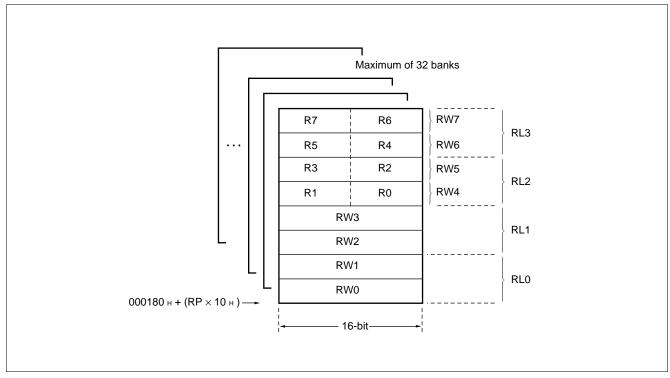

The ROM data of bank FF is reflected in the upper address of bank 00, realizing effective use of the C compiler small model. The lower 16-bit of bank FF and the lower 16-bit of bank 00 is assigned to the same address, enabling reference of the table on the ROM without stating "far".

Descriptions for read/write

R/W: Readable and writable

R: Read only W: Write only

R/W!: Bits for reading operation only or writing operation only are included. Refer to the register lists for specific resource for detailed information.

#### Descriptions for initial value

- 0: The initial value of this bit is "0".
- 1: The initial value of this bit is "1".
- X: The initial value of this bit is indeterminate.
- : This bit is not used. The initial value is indeterminate.
- \* : The storage type varies with the value of the ADCSH CREG bit.
- \*1: Access prohibited.
- \*2: The initial value varies with bus mode.
- \*3: This area is the only external access area having an address of 0000FF<sub>H</sub> or lower. Access to any of the addresses specified as reserved areas in the table is handled as if an internal area were accessed. A signal for accessing an external bus is not generated.
- \*4: When a register described as R/W! or W in the read/write column is accessed by a bit setting instruction or other read modify write instructions, the bit pointed to by the instruction becomes a set value. If a bit is writable by other bits, however, malfunction occurs. You must not, therefore, access that register using these instructions.

Note: For bits that is initialized by an reset operation, the initial value set by the reset operation is listed as an initial value. Note that the values are different from reading results.

○ : Can be used

 $\,\times\,$  : Can not be used

○ : Can be used. With Extended intelligent I/O service (EI²OS) stop function at abnormal operation.

 $\triangle$ : Can be used if interrupt request using ICR are not commonly used.

- \*1: Interrupt levels for peripherals that commonly use the ICR register are in the same level.
  - When the extended intelligent I/O service (EI<sup>2</sup>OS) is specified in a peripheral device commonly using the ICR register, only one of the functions can be used.
  - When the extended intelligent I/O service (EI<sup>2</sup>OS) is specified for one of the peripheral functions, interrupts can not be used on the other function.
- \*2: The level shows priority of same level of interrupt invoked simultaneously.

### **■ PERIPHERALS**

#### 1. I/O Port

#### (1) Input/output Port

Ports 1, 4, 5, 7 to 9, A are general-purpose I/O ports having a combined function as an external bus pin and a resource input. The input output ports function as general-purpose I/O port only in the single-chip mode. In the external bus mode, the ports are configured as external bus pins, and part of pins for port 4 can be configured as general-purpose I/O port by setting the bus control signal select register (ECSR).

#### · Operation as output port

The pin is configured as an output port by setting the corresponding bit of the DDR register to "1". Writing data to PDR register when the port is configured as output, the data is retained in the output latch in the PDR and directly output to the pin.

The value of the pin (the same value retained in the output latch of PDR) can be read out by reading the PDR register.

Note: When a read-modify-write type instruction (e.g. bit set instruction) is performed to the port data register, the destination bit of the operation is set to the specified value, not affecting the bits configured by the DDR register for output, however, values of bits configured by the DDR register as inputs are changed because input values to the pins are written into the output latch. To avoid this situation, configure the pins by the DDR register as output after writing output data to the PDR register when configuring the bit used as input as outputs.

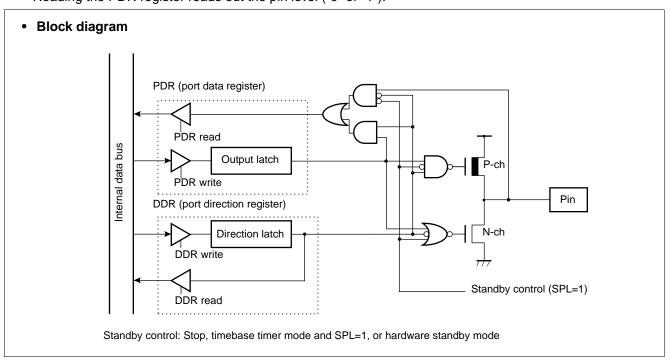

#### Operation as input port

The pin is configured as an input by setting the corresponding bit of the DDR register to "0".

When the pin is configured as an input, the output buffer is turned-off and the pin is put into a high-impedance status.

When a data is written into the PDR register, the data is retained in the output latch of the PDR, but pin outputs are unaffected.

Reading the PDR register reads out the pin level ("0" or "1").

### (2) N-ch Open-drain Port

Port 6 is general-purpose I/O port having a combined function as resource input/output. Each pin can be switched between resource and port bitwise.

#### · Operation as output port

When a data is written into the PDR register, the data is latched to the output latch of PDR. When the output latch value is set to "0", the output transistor is turned on and the pin status is put into an "L" level output, while writing "1" turns off the transistor and put the pin in a high-impedance status.

If the output pin is pulled-up, setting output latch value to "1" puts the pin in the pull-up status.

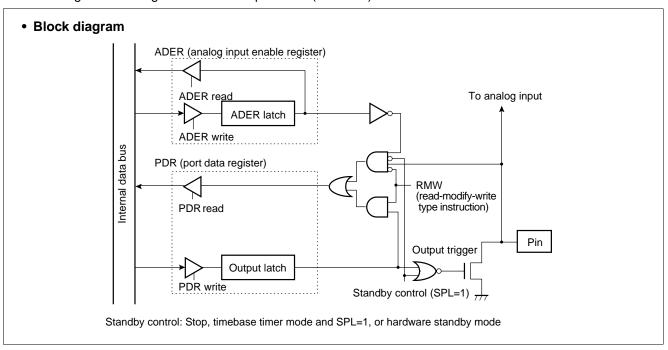

Reading the PDR register returns the pin value (same as the output latch value in the PDR).

Note: Execution of a read-modify-write instruction (e.g. bit set instruction) reads out the output latch value rather than the pin value, leaving output latch that is not manipulated unchanged.

#### · Operation as input port

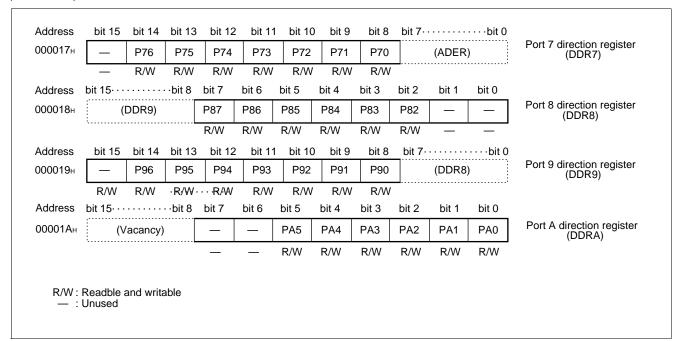

Setting corresponding bit of the PDR register to "1" turns off the output transistor and the pin is put into a high-impedance status.

Reading the PDR register returns the pin value ("0" or "1").

#### 2. Timebase Timer

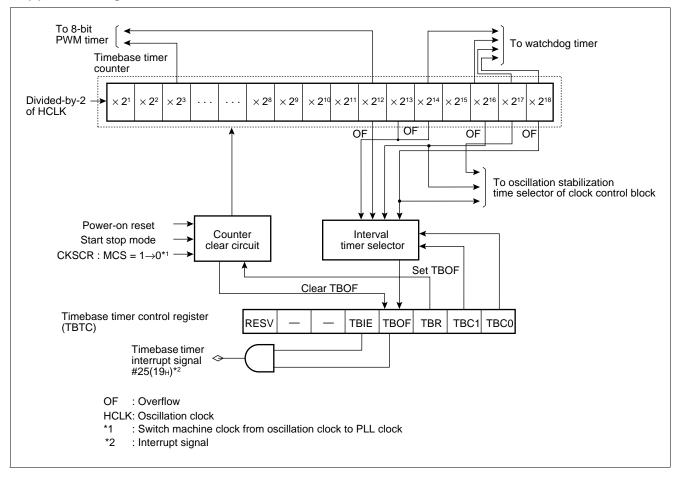

The timebase timer is a 18-bit free-run counter (timebase counter) for counting up in synchronization to the internal count clock (divided-by-2 of oscillation) with an interval timer function for selecting an interval time from four types of 2<sup>13</sup>/HCLK, 2<sup>15</sup>/HCLK, 2<sup>17</sup>/HCLK, and 2<sup>19</sup>/HCLK.

The timebase timer also has a function for supplying operating clocks for the timer output for the oscillation stabilization time or the watchdog timer etc.

### (1) Register Configuration

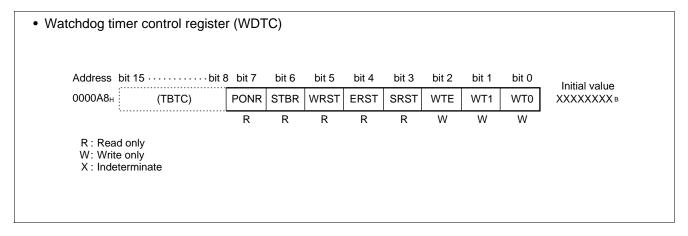

#### (2) Block Diagram

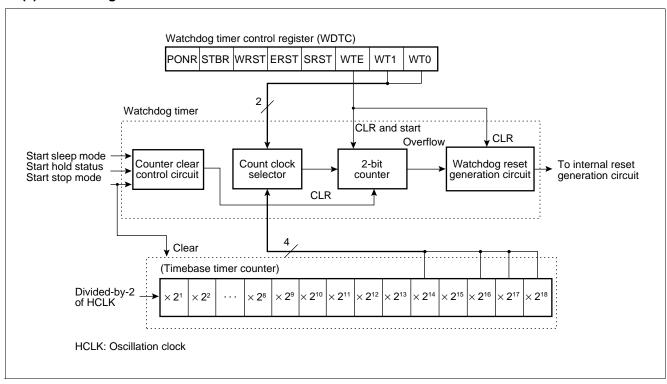

# 3. Watchdog Timer

The watchdog timer is a 2-bit counter operating with an output of the timebase timer and resets the CPU when the counter is not cleared for a preset period of time.

### (1) Register Configuration

#### (2) Block Diagram

#### 4. 8-bit PWM Timer

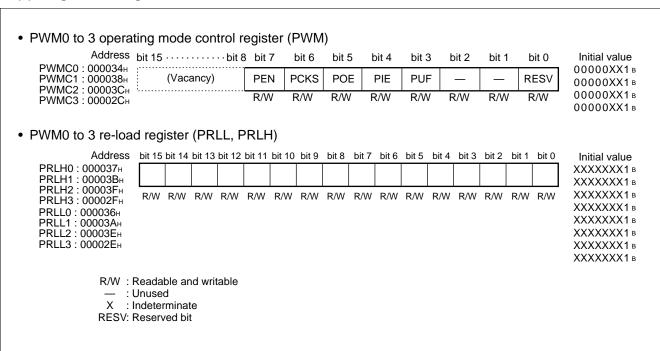

The 8-bit PWM timer is a re-load timer module that can generate a pulse wave with any period/duty ratio. It uses pulse output control according to timer operation for PWM (Pulse Width Modulation) output.

An appropriate external circuit allows the 8-bit PWM timer to operate as a D/A converter.

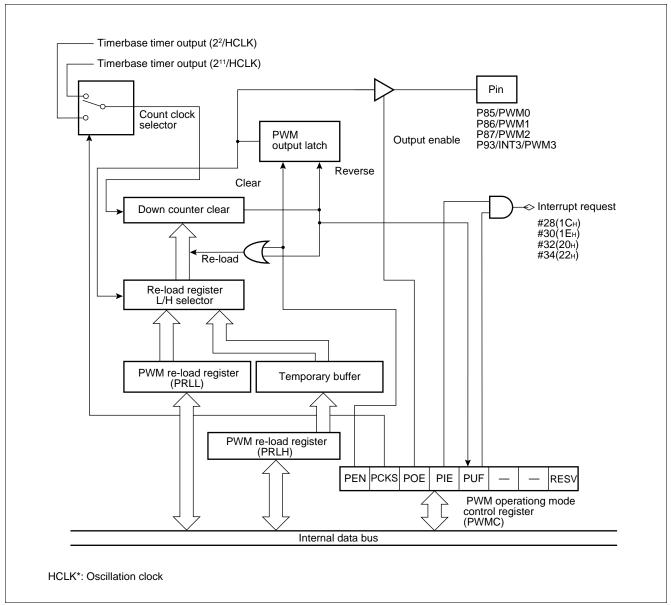

The 8-bit PWM timer module consists of two 8-bit re-load registers used to specify "H" width and "L" width and of a down counter that is loaded alternately with those values and counts down.

- A pulse waveform with any period and duty ratio is generated.
- An output pulse's duty ratio of 0.4 to 99.6 percent can be set.
- An appropriate external circuit allows this PWM timer to operate as a D/A converter.
- An interrupt request can be generated by counter underflow.
- The count clock can be selected from two types of timebase timer output.

### (1) Register Configuration

# (2) Block Diagram

#### 5. 16-bit Re-load Timer

The 16-bit re-load timer has an internal clock mode for counting down in synchronization to three types of internal clocks and an event count mode for counting down detecting a given edge of the pulse input to the external bus pin, and either of the two functions can be selectively used.

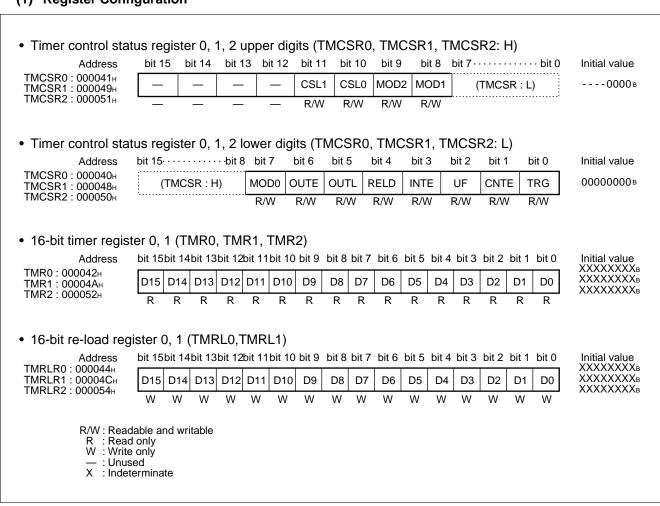

For this timer, an "underflow" is defined as the timing of transition from the counter value of "0000H" to "FFFFH". According to this definition, an underflow occurs after [re-load register setting value + 1] counts.

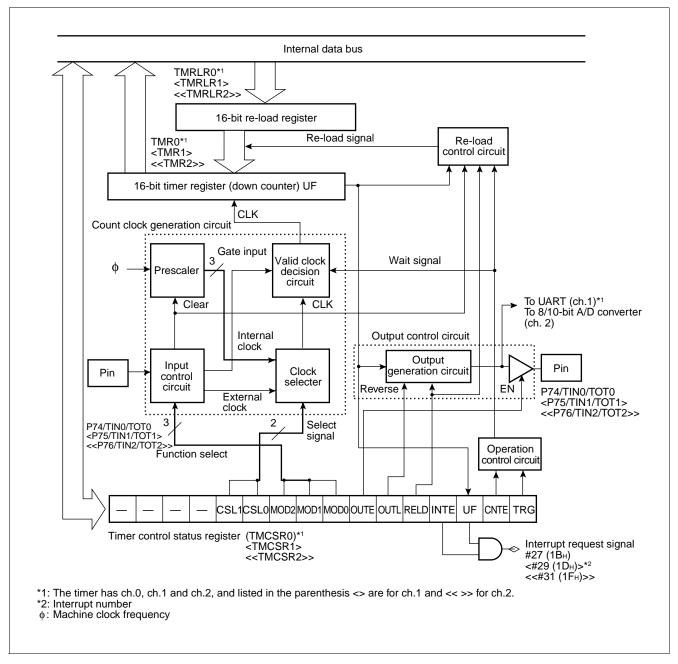

In operating the counter, the re-load mode for repeating counting operation after re-loading a counter value after an underflow or the one-shot mode for stopping the counting operation after an underflow can be selectively used.

Because the timer can generate an interrupt upon an underflow, the timer conforms to the extended intelligent I/O service (EI<sup>2</sup>OS).

The MB90246A series has 3 channels of 16-bit re-load timers.

#### (1) Register Configuration

#### 6. 16-bit I/O Timer

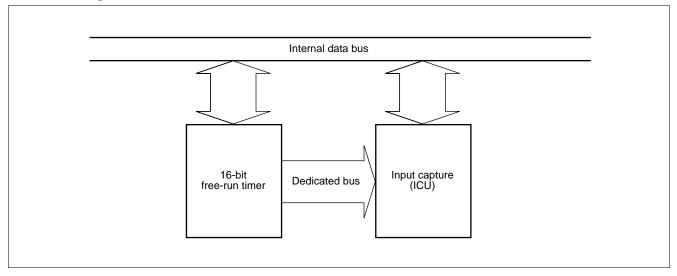

The 16-bit I/O timer module consists of one 16-bit free-run timer, two input capture (ICU) circuits, and four output comparators.

This complex module allows two independent waveforms to be output on the basis of the 16-bit free-run timer. Input pulse width and external clock periods can, therfore, be measured.

The 16-bit I/O timer consists of:

- a 16-bit free-run timer; and
- two input captures (ICU).

#### • Block diagram

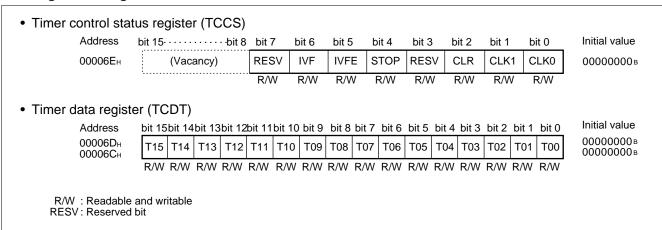

#### (1) 16-bit Free-run Timer

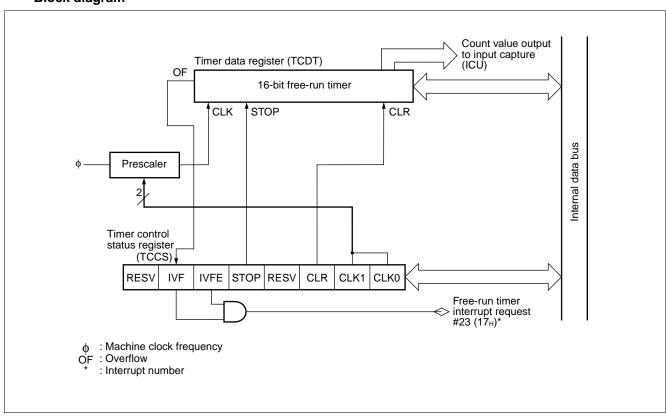

The 16-bit free-run timer consists of a 16-bit up counter, a prescaler, and a control register. The value output from the timer counter is used as basic timer (base timer) for input capture (ICU).

- A counter operation clock can be selected from four internal clocks.
- An interrupt request can be issued to the CPU by counter overflow.
- The extended intelligent I/O service (EI2OS) can be activated.
- The 16-bit free-run timer counter is cleared to "0000H" by a reset or by clearing the timer (TCCS: CLK = 0).

#### · Register configuration

#### • Block diagram

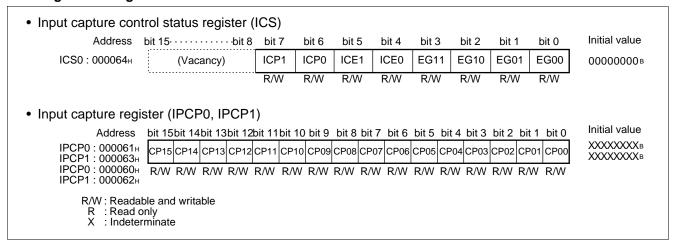

### (2) Input Capture (ICU)

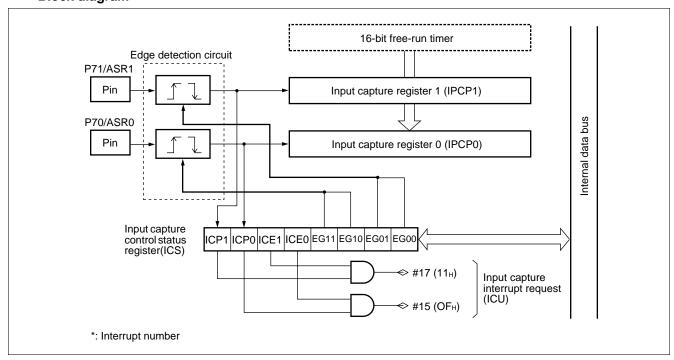

The input capture (ICU) consists of a capture register corresponding to two 16-bit external input pins, a control register, and an edge detector. Upon input of a trigger edge through an external input pin, the counter value of the 16-bit free-run timer is stored into the input capture register, and an interrupt request can be generated concurrently.

- A capture interrupt can be generated independently for each capture unit.
- The extended intelligent I/O service (EI2OS) can be activated.
- A trigger edge direction can be selected from rising/falling/both edges.
- Since two input capture units can be operated independent of each other, up to two events can be measured independently.
- The input capture function is suited for measurements of intervals (frequencies) and pulse-widths.

#### · Register configuration

#### · Block diagram

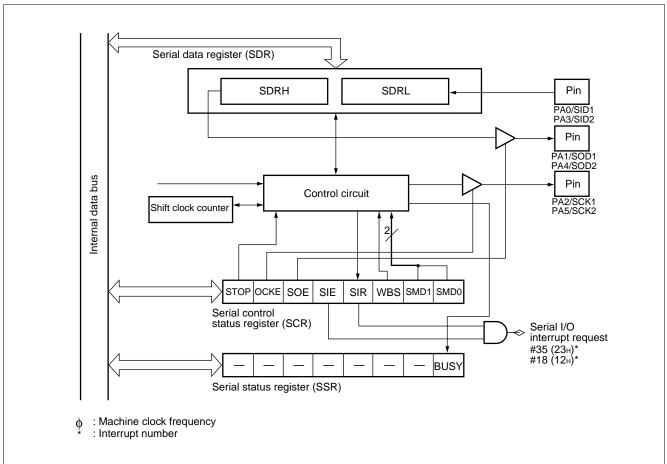

#### 7. Simple I/O Serial Interface

The 8/16-bit simple I/O serial interface transfers data synchronously with a clock.

- Communications direction: Concurrent processing of transmission (Whether data is to be sent or received must be judged by the user.)
- Transfer mode: Clock synchronization function (Only data are transferred.)
- Transfer rate: DC to φ/2 (φ: Machine clock. Frequencies of up to 8 MHz are available when the machine clock is rated at 16 MHz.)
- Shift clock: A machine clock division clock is used as the shift clock. (One of four division ratios can be selected.). A shift clock is output only during data transfer.
- Data transfer format: MSB first can be selected. 8 or 16 bits can be selected as data length. Only data are transferred.
- Interrupt request: An interrupt request is issued upon termination of transfer.
- Inter-CPU connection: Only 1:1 (bidirectional communication)

#### 8. UART

UART0 is a general-purpose serial data communication interface for performing synchronous or asynchronous communication (start-stop synchronization system). In addition to the normal duplex communication function (normal mode), UART0 has a master-slave type communication function (multi-processor mode).

- Data buffer: Full-duplex double buffer
- Transfer mode: Clock synchronized (with start and stop bit)

Clock asynchronized (start-stop synchronization system)

• Baud rate: With dedicated baud rate generator, selectable from 12 types

External clock input possible

Internal clock (A clock supplied from 16-bit re-load timer 2 can be used.)

- Data length: 7 bit to 9 bit selective (with a parity bit)
  - 6 bit to 8 bit selective (without a parity bit)
- Signal format: NRZ (Non Return to Zero) system
- · Reception error detection: Framing error

Overrun error

Parity error (not available in multi-processor mode)

• Interrupt request: Receive interrupt (receive complete, receive error detection)

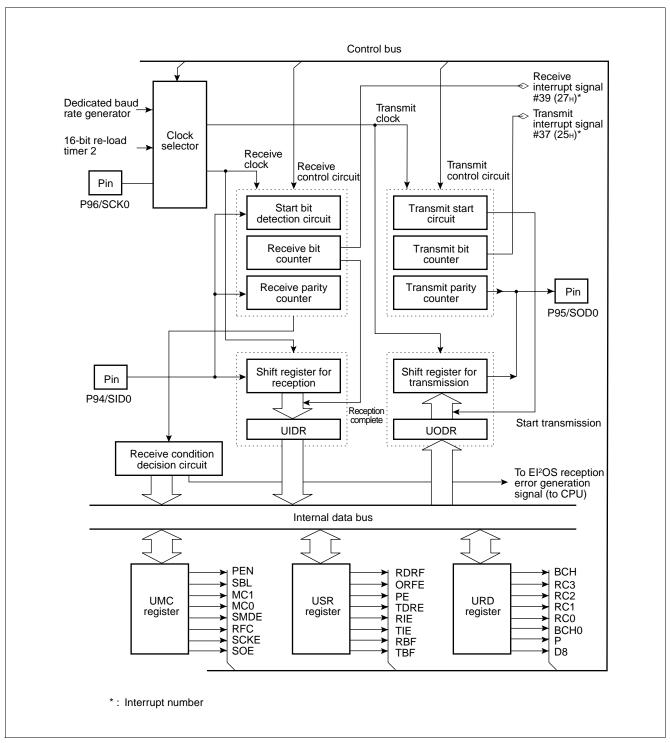

Receive interrupt (transmit complete)

Transmit/receive conforms to extended intelligent I/O service (El<sup>2</sup>OS)

 Master/slave type communication function: 1 (master) to n (slave) communication possible (multi-processor mode)

#### 9. DTP/External Interrupt Circuit

The DTP (Data Transfer Peripheral)/external interrupt circuit is located between peripheral equipment connected externally and the F<sup>2</sup>MC-16F CPU and transmit interrupt requests or data transfer requests generated by peripheral equipment to the CPU, generates external interrupt request and starts the extended intelligent I/O service (EI<sup>2</sup>OS).

#### (1) Register Configuration

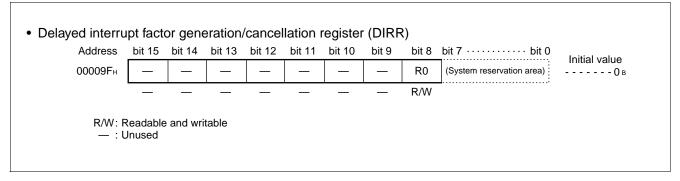

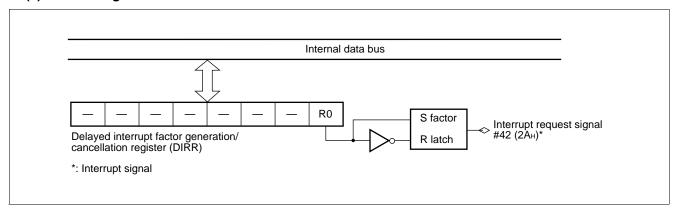

### 10. Delayed Interrupt Generation Module

The delayed interrupt generation module generates interrupts for switching tasks for development on a real-time operating system (REALOS series). The module can be used to generate softwarewise generates hardware interrupt requests to the CPU and cancel the interrupts.

This module does not conform to the extended intelligent I/O service (El<sup>2</sup>OS).

#### (1) Register Configuration

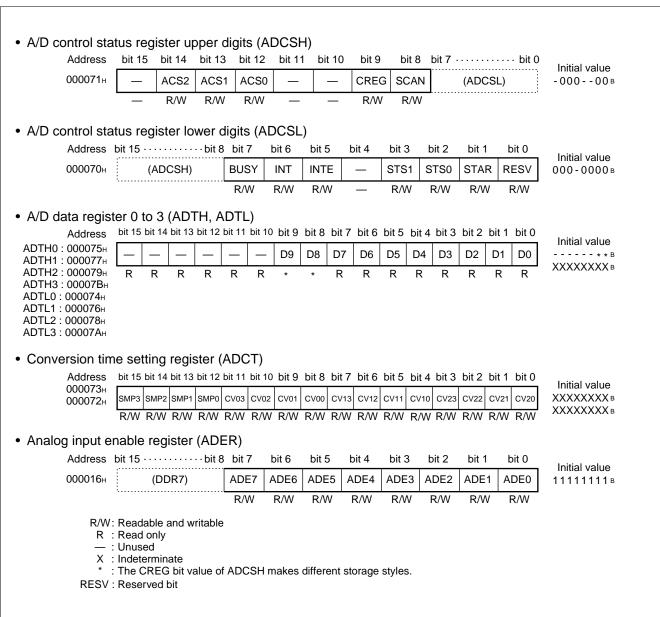

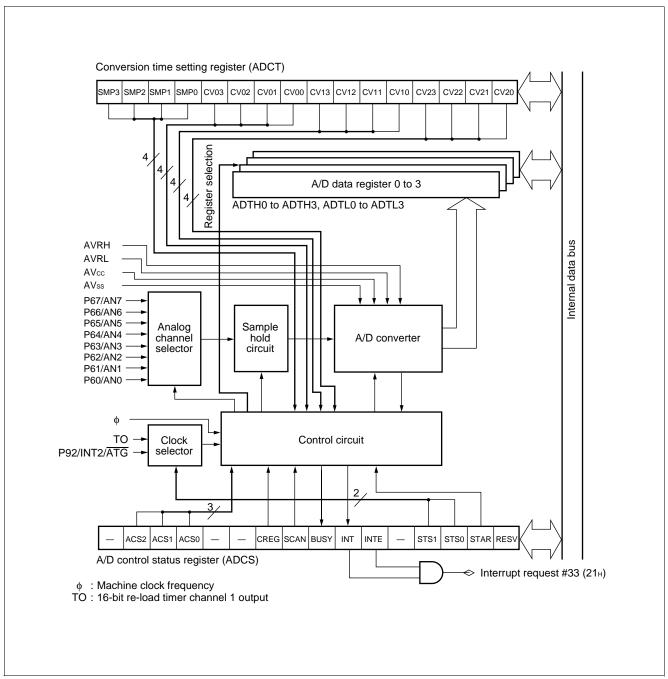

#### 11. 8/10-bit A/D Converter

The 8/10-bit A/D converter has a function of converting analog voltage input to the analog input pins (input voltage) to digital values (A/D conversion) and has the following features.

- Minimum conversion time: 6.13 μs (at machine clock of 16 MHz, including sampling time)
- Minimum sampling time: 3.75 μs (at machine clock of 16 MHz)
- Conversion time: The sampling time can be set arbitrarily.
   Serial to parallel converter with a sample hold circuit
- · Conversion method
- Resolution: 10-bit or 8-bit selective
- Analog input pins: Selectable from eight channels by software
   Single conversion mode: Single conversion for the specified channel
   Scan conversion mode: Scan conversions for maximum of four channel
- Interrupt requests can be generated and the extended intelligent I/O service (EI2OS) can be started after the end of A/D conversion.
- Starting factors for conversion: Selected from software activation, 16-bit re-load timer 1 output (rising edge), and external trigger (falling edge).
- A data buffer that covers four channels is supported. The results of conversion are stored into the data buffer.

### (1) Register Configuration

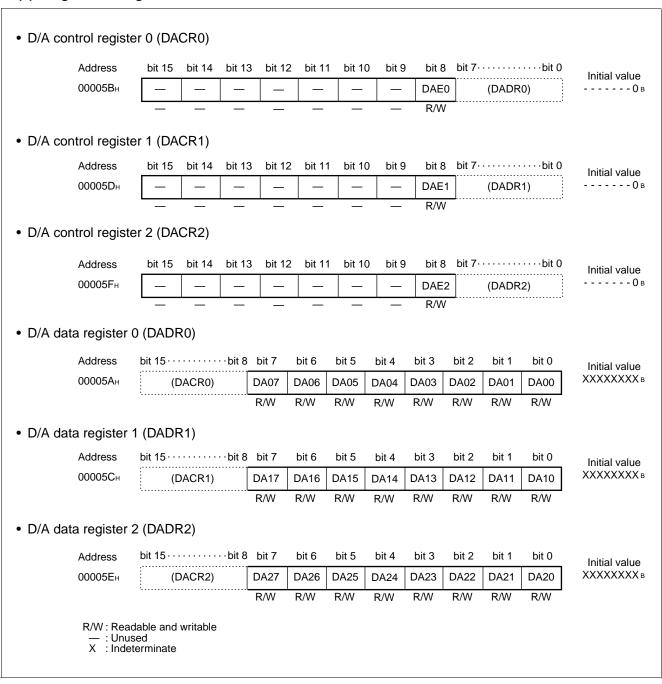

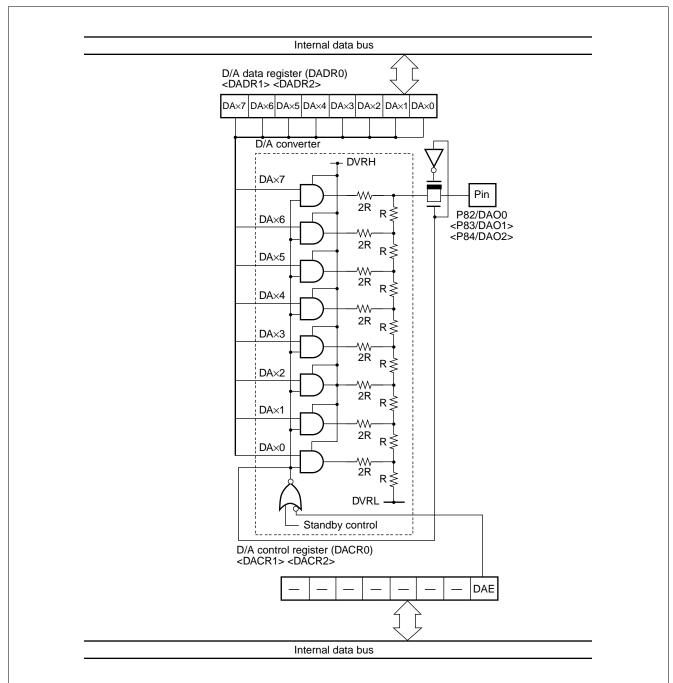

#### 12. 8-bit D/A Converter

The 8-bit D/A converter, which is based on the R-2R system, supports 8-bit resolution mode. It contains two channels each of which can be controlled in terms of output by the D/A control register.

#### (1) Register Configuration

## (2) Block Diagram

Note: The 8-bit D/A converter supports channels 0 to 2. A value enclosed by < and > is for channels 1 and 2.

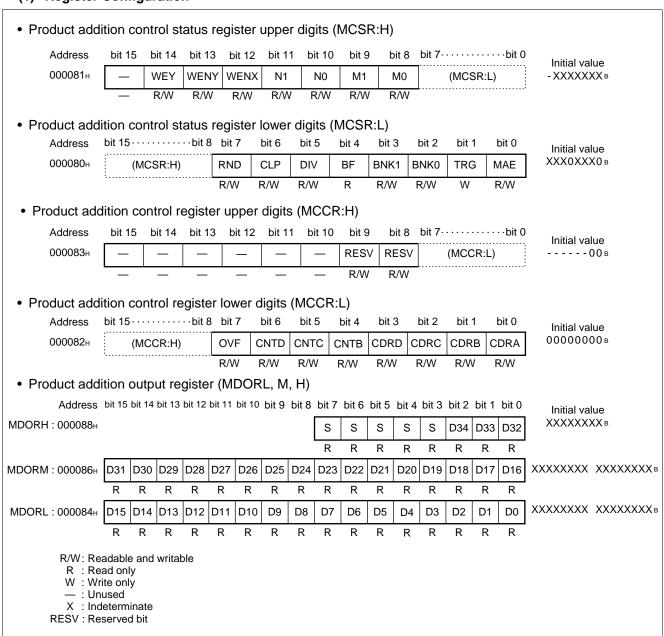

#### 13. DSP Interface for the IIR Filter

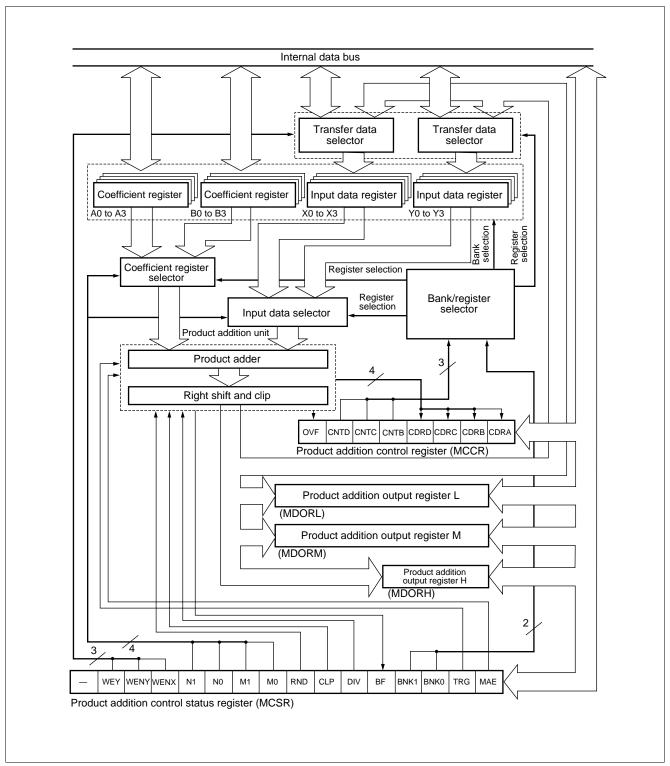

The DSP interface for the IIR filter is a unit which covers product addition ( $\Sigma Bi \times Yj + \Sigma Am \times Xn$ ) by hardware. This interface allows IIR filter calculation to be performed readily and in a high speed.

The DSP interface for the IIR filter has the following features.

- Coefficients A and B, and variables X and Y have 16-bit length, and four banks are supported.
- (1 to 4) + (1 to 4) product terms can be selected.
- Data can be rounded and clipped in units of 10 or 12 bits.
- With two or more concatenated banks used, the results of an operation can be transferred to the subsequent bank register.
- Operation time:  $((M + N + 1) \times B + 1)/\phi \mu s(M, N = number of product terms, B = number of banks, <math>\phi$ : machine clock)

#### (1) Register Configuration

#### 14. Low-power Consumption (Stand-by) Mode

The F<sup>2</sup>MC-16F has the following CPU operating mode configured by selection of an clock operation control.

#### · Stand-by mode

The hardware stand-by mode is a mode for reducing power consumption by stopping clock supply to the CPU by the low-power consumption control circuit, and stopping oscillation clock (stop mode, hardware standby mode).

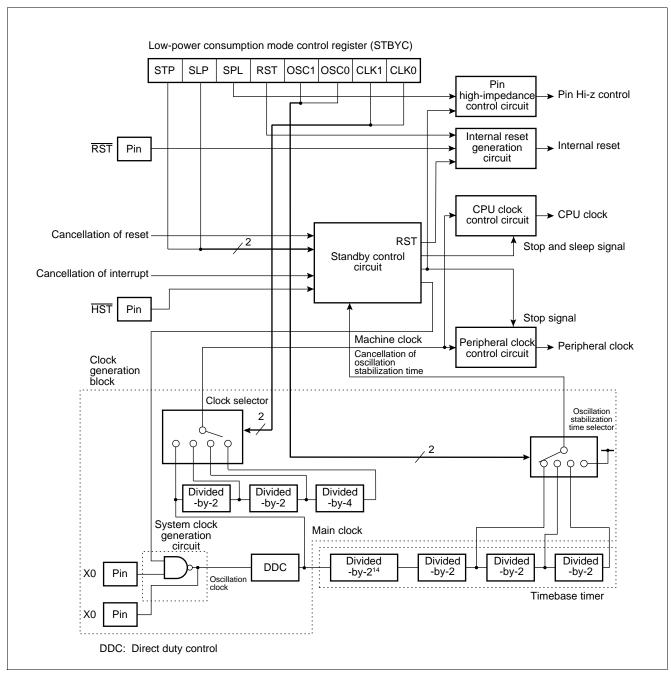

Gear function contributes to the low-power dissipation by providing options of divide-by-2, 4, or 16 external clock frequencies, whichiare usually derived from non-divided frequencies.

	AVcc	Vss - 0.3	Vss + 7.0	V	*1
Power supply voltage	AVRH, AVRL	Vss-0.3	Vss + 7.0	V	*1
	DVRH, DVRL	Vss-0.3	Vss + 7.0	V	*1
Input voltage	Vı	Vss - 0.3	Vcc + 0.3	V	*2
Output voltage	Vo	Vss - 0.3	Vcc + 0.3	V	*2
"L" level maximum output current	loL		10	mA	*3
"L" level average output current	lolav		4	mA	*4
"L" level total average output current	$\Sigma$ lolav	_	50	mA	*5
"H" level maximum output current	Іон		-10	mA	*3
"H" level average output current	loнav		-4	mA	*4
"H" level total average output current	$\Sigma$ lohav		-48	mA	*5
Power consumption	PD		600	mW	
Operating temperature	TA	-30	+70	°C	
Storage temperature	Tstg	<b>–</b> 55	+150	°C	

<sup>\*1:</sup> AVcc, AVRH, AVRL, DVRH and DVRL shall never exceed Vcc. DVRL shall never exceed DVRH. AVRL shall never exceed AVRH.

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

<sup>\*2:</sup> V<sub>1</sub> and V<sub>0</sub> shall never exceed V<sub>CC</sub> + 0.3 V.

<sup>\*3:</sup> The maximum output current is a peak value for a corresponding pin.

<sup>\*4:</sup> Average output current is an average current value observed for a 100 ms period for a corresponding pin.

<sup>\*5:</sup> Total average current is an average current value observed for a 100 ms period for all corresponding pins.

## 2. Recommended Operating Conditions

(AVss = Vss = 0.0 V)

Parameter	Symbol	Va	lue	Unit	Remarks
Parameter	Symbol	Min.	Max.	Unit	Remarks
	Vcc	4.5	5.5	V	Normal operation
Power supply voltage	Vcc	2.0	5.5	V	Retains RAM data at the time of operation stop
Operating temperature	TA	-30	+70	°C	External bus mode

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representatives beforehand.

Reset input time	<b>t</b> rstl	RST		<b>5 t</b> cyc*	_	ns	
Hardware standby input time	<b>t</b> HSTL	HST		5 tcyc*	_	ns	

<sup>\*:</sup> For toyc (cycle time (machine cycle)), see paragraph (4), "Clock output timing."

Note: Upon hardware standby input, divide-by-32 is selected as the machine cycle.

### • Measurement conditions for AC ratings

C∟is a load capacitance connected to a pin under test.

Capacitors of  $C_L$  = 30 pF should be connected to CLK pin, while  $C_L$  of 80 pF is connected to address bus (A23 to A00) and data bus (D15 to D00),  $\overline{RD}$ ,  $\overline{WRH}$  and  $\overline{WRL}$  pins.

### (2) Specification for Power-on Reset

 $(AVss = Vss = 0.0 V, T_A = -30^{\circ}C to +70^{\circ}C)$ 

Devemeter	Symbol	Pin name	Condition	Va	lue	Unit	Domarko
Parameter	Syllibol		Condition	Min.	Max.	Ullit	Remarks
Power supply rising time	<b>t</b> R	Vcc		_	30	ms	*
Power supply cut-off time	toff	Vcc	_	1	_	ms	Due to repeated operations

<sup>\*:</sup> Vcc must be kept lower than 0.2 V before power-on.

Notes: • The above ratings are values for causing a power-on reset.

- When HST is set to "L", apply power according to this table to cause a power-on reset irrespective of whether or not a power-on reset is required.
- For built-in resources in the device, re-apply power to the resources to cause a power-on reset.

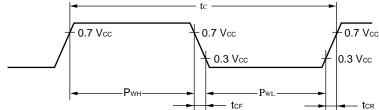

## (3) Clock Timings

• Operation at 5.0 V  $\pm 10\%$ 

 $(AVss = Vss = 0.0 \text{ V}, T_A = -30^{\circ}\text{C to } +70^{\circ}\text{C})$

#### \*1: Glossary for conversion time

<sup>\*2:</sup> IAS and IRS signify currents when the A/D converter does not operate and when the CPU is out of service, respectively.

#### 6. A/D Converter Glossary

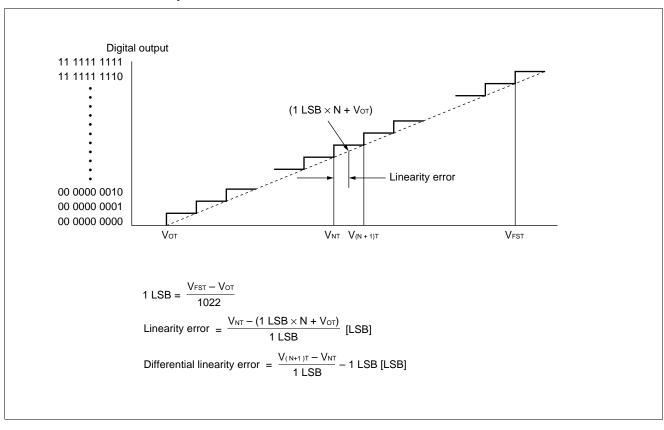

Resolution: Analog changes that are identifiable with the A/D converter

With 10 bits supported, an analog voltage can be divided into 2<sup>10</sup> parts.

Linearity error: The deviation of the straight line connecting the zero transition point ("00 0000 0000" ↔ "00 0000 0001") with the full-scale transition point ("11 1111 1110" ↔ "11 1111 1111") from actual conversion characteristics

Differential linearity error: The deviation of input voltage needed to change the output code by 1 LSB from the theoretical value

Total error: The total error is defined as a difference between the actual value and the theoretical value, which includes zero-transition error/full-scale transition error, linearity error, differential linearity error and error caused by noise.

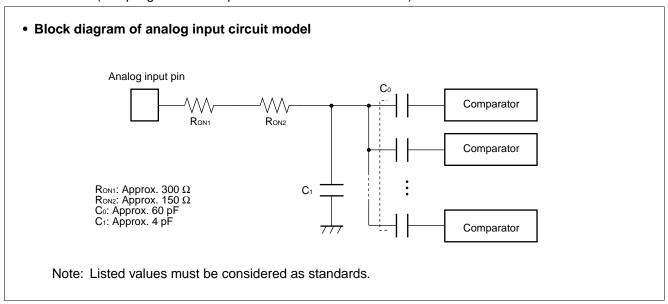

#### 7. Notes on Using A/D Converter

Select the output impedance value for the external circuit of analog input according to the following conditions. Output impedance values of the external circuit of 300  $\Omega$  or lower are recommended.

When capacitors are connected to external pins, the capacitance of several thousand times the internal capacitor value is recommended to minimized the effect of voltage distribution between the external capacitor and internal capacitor.

When the output impedance of the external circuit is too high, the sampling time for analog voltages may not be sufficient (sampling time = 0.56 µs @machine clock of 16 MHz).

#### • Error

The smaller the | AVRH – AVRL |, the greater the error would become relatively.

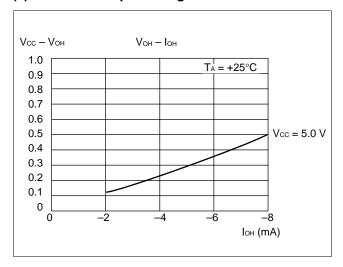

#### 8. 8-bit D/A Converter Electrical Characteristics

 $(AVcc = Vcc = 4.5 \text{ V to } 5.5 \text{ V}, AVss = Vss = 0.0 \text{ V}, T_A = -30^{\circ}\text{C to } +70^{\circ}\text{C})$

### ■ INSTRUCTIONS (421 INSTRUCTIONS)

Table 1 Description of Items in Instruction List

Item	Description
Mnemonic	English upper case and symbol: Described directly in assembler code. English lower case: Converted in assembler code. Number of letters after English lower case: Describes bit width in code.
#	Describes number of bytes.
~	Describes number of cycles. For other letters in other items, refer to table 4.
В	Describes correction value for calculating number of actual states.  Number of actual states is calculated by adding value in the ~section.
Operation	Describes operation of instructions.
LH	Describes a special operation to 15 bits to 08 bits of the accumulator.  Z: Transfer 0.  X: Sign-extend and transfer.  -: No transmission
АН	Describes a special operation to the upper 16-bit of the accumulator.  *: Transmit from AL to AH.  -: No transfer.  Z: Transfer 00H to AH.  X: Sign-extend AL and transfer 00H or FFH to AH.
I	Describes status of I (interrupt enable), S (stack), T (sticky bit), N (negative), Z (zero),
S	V (overflow), and C (carry) flags.  * : Changes after execution of instruction.
Т	-: No changes.
N	S: Set after execution of instruction. R: Reset after execution of instruction.
Z	
V	
С	
RMW	Describes whether or not the instruction is a read-modify-write type (a data is read out from memory etc. in single cycle, and the result is written into memory etc.).  * : Read-modify-write instruction  - : Not read-modify-write instruction  Note: Not used to addresses having different functions for reading and writing operations.

Table 2 Description of Symbols in Instruction Table

Item	Description
A	32-bit accumlator The bit length is dependent on the instructions to be used. Byte: Lower 8-bit of AL Word:16-bit of AL Long: AL: 32-bit of AH
AH	Upper 16-bit of A
AL	Lower 16-bit of A
SP	Stack pointer (USP or SSP)
PC	Program counter
SPCU	Stack pointer upper limited register
SPCL	Stack pointer lower limited register
PCB	Program bank register
DTB	Data bank register
ADB	Additional data bank register
SSB	System stack bank register
USB	User stack bank register
SPB	Current stack bank register (SSB or USB)
DPR	Direct page register
brg1	DTB, ADB, SSB, USB, DPR, PCB
brg2	DTB, ADB, SSB, USB, DPR
Ri	R0, R1, R2, R3, R4, R5, R6, R7
RWi	RW0, RW1, RW2, RW3, RW4, RW5, RW6, RW7
RWj	RW0, RW1, RW2, RW3
RLi	RL0, RL1, RL2, RL3
dir addr16 addr24 ad24 0 to 15 ad24 16 to 23	Specify shortened direct address. Specify direct address. Specify physical direct address. bit0 to bit15 of addr24 bit16 to bit 23 of addr24
io	I/O area (000000н to 0000FFн)
#imm4 #imm8 #imm16 #imm32 ext (imm8)	4-bit immediate data 8-bit immediate data 16-bit immediate data 32-bit immediate data 16-bit data calculated by sign-extending an 8-bit immediate data
disp8 disp16	8-bit displacement 16-bit displacement
bp	Bit offset value
vct4 vct8	Vector number (0 to 15) Vector number (0 to 255)

(Continued)

#### (Continued)

Item	Description
( )b	Bit address
rel ear eam	Specify PC relative branch. Specify effective address (code 00 to 07). Specify effective address (code 08 to 1F).
rlst	Register allocation

Table 3 Effective Address Field

Code	;	Symbol		Address type	Number of bytes in address extension block*
00 01 02 03 04 05 06 07	R0 R1 R2 R3 R4 R5 R6 R7	RW0 RW1 RW2 RW3 RW4 RW5 RW6 RW7	RL0 (RL0) RL1 (RL1) RL2 (RL2) RL3 (RL3)	Register direct "ea" corresponds to byte, word, and long word from left respectively.	_

18 19 1A 1B	@RW0 + disp16 @RW1 + disp16 @RW2 + disp16 @RW3 + disp16			Register indirect with 16-bit displacement	2
1C 1D 1E 1F	@RW0 + RW7 @RW1 + RW7 @PC + disp16 addr16			0 0 2 2	

Note: Number of bytes for address extension corresponds to "+" in the # (number of bytes) part in the instruction table.

Table 4 Number of Execution Cycles in Addressing Modes

Code	Operand	(a)*
Code	Operand	Number of execution cycles for addressing modes
00 to 07	Ri RWi RLi	Listed in instruction table
08 to 0B	@RWj	1
0C to 0F	@RWj +	4
10 to 17	@RWi + disp8	1
18 to 1B	@RWj + disp16	1
1C 1D 1E 1F	@RW0 + RW7 @RW1 + RW7 @PC + disp16 addr16	2 2 2 1

Note: (a) is used for ~ (number of cycles) and B (correction value) in instruction table.

Table 5 Correction Value for Number of Cycles for Calculating Actual Number of Cycles

Operand	(b)*	(c)*	(d)*
Operand	byte	word	long
Internal register	+0	+0	+0
Internal RAM even address Internal RAM odd address	+0 +0	+0 +1	+0 +2
Other than internal RAM even address Other than internal RAM odd address	+1 +1	+1 +3	+2 +6
External data bus 8-bit	+1	+3	+6

Notes: • (b), (c), (d) is used for ~ (number of cycles) and B (correction value) in instruction table.

- \*11:Set to 3 when word (AH) is zero, 12 when the result is positive, and 13 when the result is negative.
- \*12:Set to 3 when word (ear) is zero, 16 when the result is positive, and 19 when the result is negative.
- \*13:Set to 4 + (a) when word (eam) is zero, 17 + (a) when the result is positive, and 20 + (a) when the result is negative.

Note: When overflow occurs during DIV or DIVW instruction execution, the number of execution cycles takes two values because of detection before and after an operation.

When overflow occurs during DIV or DIVW instruction execution, the contents of AL are destroyed.

© FUJITSU LIMITED Printed in Japan

All Rights Reserved.

The contents of this document are subject to change without notice. Customers are advised to consult with FUJITSU sales representatives before ordering.

The information and circuit diagrams in this document are presented as examples of semiconductor device applications, and are not intended to be incorporated in devices for actual use. Also, FUJITSU is unable to assume responsibility for infringement of any patent rights or other rights of third parties arising from the use of this information or circuit diagrams.

FUJITSU semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

CAUTION:

Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with FUJITSU sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

Any semiconductor devices have an inherent chance of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Law of Japan, the prior authorization by Japanese government will be required for export of those products from Japan.
