

The comparator has a charge pump output with an amplifier stage around which feedback may be applied. Only one external transistor is required for varicap line driving.

## Functional Description

The SP5026 contains all the elements necessary, with the exception of reference crystal, loop filter and external high voltage transistor to control a voltage controlled local oscillator, so forming a PLL frequency synthesized source.

The system is controlled by a microprocessor via a standard data, clock enable three-wire bus. The data load normally consists of a single word, which contains the frequency and port information and is only transferred to the internal data shift register during an enable high period. The clock input is disabled during enable low periods. New data words are only accepted by the internal data buffers from the shift register on a negative transition of the enable, so giving improved fine tune facility for digital AFC etc.

The data sequence and timing follows the format shown in Figure 3.

The frequency is set by loading the programmable divider with the required 14/15 bit divisor word. The output of the divider,  $F_{PD}$ , is fed to the phase comparator where it is compared in phase and frequency domain to the internal generated comparison frequency,  $F_{COMP}$ .

The  $F_{COMP}$  is obtained by dividing the output of an on-chip crystal controlled oscillator. The crystal frequency used is generally 4MHz, which gives an  $F_{COMP}$  of 3.90625kHz/7.815kHz and, when multiplied back up to the synthesized LO, gives a minimum step size of 31.25kHz/62.5kHz, respectively.

The programmable divider is preceded by an input RF preamplifier and high speed, low radiation prescaler. The preamplifier is arranged to be self oscillating, so giving excellent input sensitivity. The input sensitivity and impedance are shown in Figure 5 and Figure 7 respectively.

The SP5026 contains an improved lock detect circuit which generates a flag when the loop has attained lock. "Out of Lock" is indicated by high impedance state.

The SP5026 contains 4 general purpose open collector outputs, ports P1-P4, which are capable of sinking at least 10mA. These outputs are set by the remaining four bits within the normal data word.

### **Pin Compatibility**

The SP5026 may be used in SP5510 applications which require 3-wire bus as opposed to  $I^2C$  bus data format. In SP5510 applications where the reference crystal is connected to pin 3, a small modification is required to ground the crystal as shown in Figure 4.

Appropriate connections to the mode select input (pin 3) must also be made.

In mode 1 (pin 3 "HIGH") the SP5026 is programming and step size compatible with the Toshiba TD6380, and in mode 2 (pin 3 "LOW") it is compatible with the TD6381.
