

Description

The CXK77B3641A (organized as 131,072 words by 36 bits) and the CXK77B1841A (organized as 262,144 words by 18 bits) are high speed BiCMOS synchronous static RAMs with common I/O pins. These synchronous SRAMs integrate input registers, high speed RAM, output registers/latches, and a one-deep write buffer onto a single monolithic IC. Three distinct read operation protocols, Register - Register (R-R), Register - Latch (R-L), and Register - Flow Thru (R-FT), and one write operation protocol, Late Write (LW), are supported, providing a flexible, high-performance user interface.

All address, data, and control input signals except \bar{G} (Output Enable) and ZZ (Sleep Mode) are registered on the positive edge of K clock. Read operation protocol is selectable through external mode pins M1 and M2.

Write operations are internally self-timed, eliminating the need for complex off-chip write pulse generation. In Register - Latch and Register - Flow Thru modes, when $\bar{S}W$ (Global Write Enable) is driven active, the subsequent positive edge of K clock tristates the SRAM's output drivers immediately, allowing Read-Write-Read operations to be initiated consecutively, with no dead cycles between them.

Sleep (power down) mode control is provided through the asynchronous ZZ input. 300 MHz operation is obtained from a single 3.3V power supply. JTAG boundary scan interface is provided using a subset of IEEE standard 1149.1 protocol.

Features

	R-R Mode	R-L, R-FT Modes
• Fast Cycle / Access Time	t_{KHKH} / t_{KHQV}	t_{KHKH} / t_{KHQV}
-----	-----	-----
-33	3.3ns / 2.3ns	5.0ns / 5.0ns
-37	3.6ns / 2.4ns	5.3ns / 5.3ns
-5	5.0ns / 2.5ns	5.3ns / 5.3ns
-6	6.0ns / 2.5ns	6.0ns / 6.0ns

- Single 3.3V power supply (V_{DD}): 3.3V \pm 5%
- Register - Register (R-R), Register - Latch (R-L), or Register - Flow Thru (R-FT) read operations
- Read operation protocol selectable via dedicated mode pins (M1, M2)
- Fully coherent, late write, self-timed write operations
- Byte Write capability
- Differential input clocks (K/\bar{K})
- Asynchronous output enable (\bar{G})
- Dedicated output supply voltage (V_{DDQ}): 2.5V or 3.3V typical
- LVTTTL/LVCMOS-compatible I/O interface
- Sleep (power down) mode via dedicated mode pin (ZZ)
- JTAG boundary scan (subset of IEEE standard 1149.1)
- 119 pin (7x17), 1.27mm pitch, 14mm x 22mm Plastic Ball Grid Array (PBGA) package

2. Pad Location 6B is a true no-connect. However, it is defined as an SA address input in 8Mb and 16Mb LW SRAMs.
3. Pad Location 2B is a true no-connect. However, it is defined as an SA address input in 16Mb LW SRAMs.
4. Pad Location 4D is a true no-connect. However, it is defined as a ZQ output impedance control resistor input in HSTL LW SRAMs.
5. Pad Locations 3J and 5J are true no-connects. However, they are defined as V_{REF} input reference voltage inputs in HSTL LW SRAMs.

Pin Description

Symbol	Type	Description
SA	Input	Synchronous Address Inputs - Registered on the rising edge of K.
DQa, DQb DQc, DQd	I/O	Synchronous Data Inputs / Outputs - Registered on the rising edge of K during write operations. DQa - indicates Data Byte a DQb - indicates Data Byte b DQc - indicates Data Byte c DQd - indicates Data Byte d
K, \bar{K}	Input	Differential Input Clocks
C, \bar{C}	Input	Differential Output Control Clocks - Reserved for future use.
\bar{SS}	Input	Synchronous Select Input - Registered on the rising edge of K. $\bar{SS} = 0$ specifies a Write Operation when $\bar{SW} = 0$ specifies a Read Operation when $\bar{SW} = 1$ $\bar{SS} = 1$ specifies a Deselect Operation
\bar{SW}	Input	Synchronous Global Write Enable Input - Registered on the rising edge of K. $\bar{SW} = 0$ specifies a Write Operation when $\bar{SS} = 0$ $\bar{SW} = 1$ specifies a Read Operation when $\bar{SS} = 0$
$\bar{SBW}a, \bar{SBW}b,$ $\bar{SBW}c, \bar{SBW}d$	Input	Synchronous Byte Write Enable Inputs - Registered on the rising edge of K. $\bar{SBW}a = 0$ specifies write Data Byte a when $\bar{SS} = 0$ and $\bar{SW} = 0$ $\bar{SBW}b = 0$ specifies write Data Byte b when $\bar{SS} = 0$ and $\bar{SW} = 0$ $\bar{SBW}c = 0$ specifies write Data Byte c when $\bar{SS} = 0$ and $\bar{SW} = 0$ $\bar{SBW}d = 0$ specifies write Data Byte d when $\bar{SS} = 0$ and $\bar{SW} = 0$
\bar{G}	Input	Asynchronous Output Enable Input - De-asserted (high) forces the data output drivers to Hi-Z.
ZZ	Input	Asynchronous Sleep Mode Input - Asserted (high) forces the SRAM into low-power mode.
M1, M2	Input	Read Operation Protocol Select - These mode pins must be tied to V_{DD} or V_{SS} before power-up. M1:M2 = 00 specifies Register - Flow Thru Read Operations M1:M2 = 01 specifies Register - Register Read Operations M1:M2 = 10 specifies Register - Latch Read Operations M1:M2 = 11 reserved for future use
V_{DD}		3.3V Core Power Supply - Core supply voltage.
V_{DDQ}		Output Power Supply - Output buffer supply voltage.
V_{SS}		Ground
TCK	Input	JTAG Clock
TMS	Input	JTAG Mode Select
TDI	Input	JTAG Data In
TDO	Output	JTAG Data Out
NC		No Connect - These pins are true no-connects, i.e. there is no internal chip connection to these pins. They can be left unconnected or tied directly to V_{DD} or V_{SS} .

L	L	L	H	X	Abort Write	Hi - Z	X	I _{DD}

•Read Operations

These devices support three distinct JEDEC standard read protocols via mode pins M1 and M2. The mode pins must be set during power-up, and cannot change during SRAM operation.

Mode Select Truth Table.

	M1	M2
Register - Register	L	H
Register - Flow Thru	L	L
Register - Latch	H	L
Reserved	H	H

When a read operation is initiated, all address and control signals (except \bar{G} and ZZ) are latched into input registers on the rising edge of K clock. The latched address is decoded and then used to access a particular location in the internal memory array. These two events occur regardless which read protocol is selected. After the memory location is accessed, the read protocol determines when data from that memory location is driven valid externally.

Register - Register Mode

In Register - Register mode, data is driven valid externally from the subsequent rising edge of K clock, one full K clock cycle after the address is latched. Data remains valid until at least the next rising edge of K clock, one full K clock cycle thereafter.

Register - Latch Mode

In Register - Latch mode, data is driven valid externally from the subsequent falling edge of K clock, or, some minimum amount of time after the address is latched (determined by the access time of the memory array), whichever is greater. Data remains valid until at least the next falling edge of K clock, approximately one full K clock cycle thereafter.

Register - Flow Thru Mode

In Register - Flow Thru mode, data is driven valid immediately, some minimum amount of time after the address is latched (determined by the access time of the memory array). Data remains valid until at least the next rising edge of K clock, approximately one full K clock cycle thereafter.

Regardless which read protocol is selected, read operations may be initiated consecutively, with no dead cycles between them.

•Write Operations

These devices follow a Late Write protocol, where, during a write operation, data is provided to the SRAM one clock cycle after the address and control signals, eliminating the need for one of the bus-turnaround cycles required when changing from a read to a write operation. The Late Write function is controlled internally by using a dedicated one-deep write buffer to store the address and data signals associated with the current write operation. The buffered data is not actually written to the memory array until the next write operation is initiated.

When a write operation is initiated, all address and control signals (except \bar{G} and ZZ) are latched into input registers on the rising edge of K clock. Also at this time, any valid data currently stored in the one-deep write buffer (associated with the previous write operation) is written to the memory array. On the subsequent rising edge of K clock, the data and address signals for the current write operation are stored in the write buffer. This write pipeline mechanism allows write operations to be initiated consecutively, with no dead cycles between them.

Note: In order to maintain coherency, if a read operation is initiated to the same address as that of the last write operation (i.e. to the address of the write operation currently stored in the write buffer), read data is provided from the write buffer instead of the memory array. If only some of the bytes of data in the write buffer are valid, those bytes of data that are valid are provided from the write buffer, and those bytes of data that are invalid are provided from the memory array.

•Sleep (Power Down) Mode

Sleep (power down) mode is provided through the asynchronous input signal ZZ . When ZZ is asserted (high), the output drivers will go to a Hi-Z state, and the SRAM will begin to draw standby current. Contents of the memory array will be preserved. An enable time (t_{ZZE}) must be met before the SRAM is guaranteed to be in sleep mode, and a recovery time (t_{ZZR}) must be met before the SRAM can resume normal operation.

•Power-Up Sequence

Power supplies must power up in the following sequence: V_{SS} , V_{DD} , V_{DDQ} , V_{REF} and Inputs. V_{DDQ} must never exceed V_{DD} .

•Absolute Maximum Ratings⁽¹⁾

Item	Symbol	Rating	Unit
Supply Voltage	V_{DD}	-0.5 to +4.6	V
Output Supply Voltage	V_{DDQ}	-0.5 to +4.6	V
Input Voltage	V_{IN}	-0.5 to $V_{DD}+0.5$ (4.6V max.)	V
Output Voltage	V_{OUT}	-0.5 to $V_{DDQ}+0.5$ (4.6V max.)	V
Operating Temperature	T_A	0 to 85	°C
Junction Temperature	T_J	0 to 110	°C
Storage Temperature	T_{STG}	-55 to 150	°C

⁽¹⁾Stresses greater than those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions other than those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

•PBGA Package Thermal Characteristics

		Sample Form	Ambient	Air Flow (m/s)	Thermal Resistance (°C/W)	Reference
1	θ_{JA}	PKG only	Room Temp	0 1 2 3	81.0 36.9 29.5 26.1	Max Thermal Resistance
2	θ_{JA}	PKG on Board A*	Room Temp	0 1 2 3	32.4 23.8 20.7 18.6	*Board A is a two layer printed circuit board with very low density trace in both layers.
3	θ_{JA}	PKG on Board B**	Room Temp	0 1 2 3	16.0 12.9 12.0 11.3	**Board B is a four layer printed circuit board, same as Board A except with two GND planes in the middle layers.
4	θ_{JC}	PKG only	DI Water	-	3.6	Min Thermal Resistance

Board size & thickness (Board A, B): 7.62W x 11.43L x 1.57T (mm)

•DC Recommended Operating Conditions

(V_{SS} = 0V, T_A = 0 to 85°C)

Item		Symbol	Min	Typ	Max	Unit	
Supply Voltage ⁽¹⁾		V _{DD}	3.13	3.3	3.47	V	
Output Supply Voltage ⁽²⁾		V _{DDQ}	2.37	2.5, 3.3	3.47	V	
Input High Voltage ⁽³⁾		V _{IH}	1.65	---	V _{DD} + 0.3	V	
Input Low Voltage ⁽⁴⁾		V _{IL}	-0.3	---	1.15	V	
Clock ⁽⁵⁾	LVTTTL	Input Signal Voltage	V _{KIN}	-0.3	---	V _{DD} + 0.3	V
		Input Differential Voltage	V _{DIF}	0.5	---	V _{DD} + 0.6	V
		Input Common Mode Voltage	V _{CM}	1.15	1.4	1.75	V
		Input Cross Point Voltage	V _X	1.15	1.4	1.75	V
	PECL	Input High Voltage	V _{IH-PECL}	2.135	---	2.420	V
		Input Low Voltage	V _{IL-PECL}	1.480	---	1.825	V

(1) V_{DD} (Max) up to 3.78V is supported. 3.47V is recommended for power consumption purposes only.

(2) For V_{DDQ} = 2.5V or V_{DDQ} = 3.3V applications.

(3) V_{IH} (Max) AC = V_{DD} + 1.5V for pulse width less than 2.0 ns.

(4) V_{IL} (Min) AC = -1.5V for pulse width less than 2.0 ns.

(5) These devices support three different input clocking schemes:

- a. LVTTTL Differential - In this scheme, both clock inputs (K and \bar{K}) are driven differentially to the same voltage levels as the other inputs, i.e. from V_{SS} to V_{DDQ} nominally. V_{KIN}, V_{DIF} and V_{CM} must all be considered when using this scheme.
- b. LVTTTL Single Ended - In this scheme, one of the two clock inputs (either K or \bar{K}) is driven to the same voltage levels as the other inputs, i.e. from V_{SS} to V_{DDQ} nominally, while the other clock input (either \bar{K} or K) is tied to an external reference voltage (V_X). V_{KIN}, V_{DIF} and V_X must all be considered when using this scheme.
- c. PECL Differential - In this scheme, both clock inputs (K and \bar{K}) are driven differentially according to PECL guidelines. Both V_{IH-PECL} and V_{IL-PECL} must be considered when using this scheme.

•I/O Capacitance

(T_A = 25°C, f = 1 MHz)

Item	Symbol	Test conditions	Min	Max	Unit
Input Capacitance	C _{IN}	V _{IN} = 0V	---	6	pF
Clock Input Capacitance	C _{CLK}	V _{IN} = 0V	---	6	pF
Output Capacitance	C _{OUT}	V _{OUT} = 0V	---	7	pF

Note: These parameters are sampled and are not 100% tested.

•DC Electrical Characteristics

 $(V_{DD} = 3.3V \pm 5\%, V_{SS} = 0V, T_A = 0 \text{ to } 85^\circ\text{C})$

Item	Symbol	Test Conditions	Min	Typ	Max	Unit
Input Leakage Current	I_{LI}	$V_{IN} = V_{SS} \text{ to } V_{DD}$	-1	---	1	μA

1. All parameters are specified over the range $T_A = 0$ to 85°C .

2. These parameters are sampled and are not 100% tested.

3. R-FT mode operation is verified functionally, but associated timing parameters are guaranteed by design only and are not 100% tested.

Test Mode Description

Functional Description

These devices provide a JTAG boundary scan interface using a limited set of IEEE std. 1149.1 functions. The test mode is intended to provide a mechanism for testing the interconnect between master (processor, controller, etc.), SRAMs, other components and the printed circuit board.

In conformance with a subset of IEEE std. 1149.1, these devices contain a TAP controller, Instruction register, Boundary scan register and Bypass register.

JTAG Inputs/Outputs are LVTTL compatible only.

Test Access Port (TAP)

4 pins as defined in the Pin Description table are used to perform JTAG functions. The TDI input pin is used to scan test data serially into one of three registers (Instruction register, Boundary Scan register and Bypass register). TDO is the output pin used to scan test data serially out. The TDI pin sends the data into LSB of the selected register and the MSB of the selected register feeds the data to TDO. The TMS input pin controls the state transition of 16 state TAP controller as specified in IEEE std. 1149.1. Inputs on TDI and TMS are registered on the rising edge of TCK clock. The output data on TDO is presented on the falling edge of TCK. TDO driver is in active state only when TAP controller is in Shift-IR state or in Shift-DR state.

TCK, TMS, TDI must be tied low when JTAG is not used.

TAP Controller

16 state controller is implemented as specified in IEEE std. 1149.1.

The controller enters reset state in one of two ways:

1. Power up.
2. Apply a logic 1 on TMS input pin on 5 consecutive TCK rising edges.

Instruction Register (3 bits)

The JTAG Instruction register consists of a shift register stage and parallel output latch. The register is 3 bits wide and is encoded as follow:

<u>Octal</u>	<u>MSB.....LSB</u>			<u>Instruction</u>
0	0	0	0	Bypass
1	0	0	1	IDCODE. Read device ID
2	0	1	0	Sample-Z. Sample Inputs and tri-state DQs
3	0	1	1	Bypass
4	1	0	0	Sample. Sample Inputs.
5	1	0	1	Private. Manufacturer use only.
6	1	1	0	Bypass
7	1	1	1	Bypass

Bypass Register (1 bit)

The Bypass Register is one bit wide and is connected electrically between TDI and TDO and provides the minimum length serial path between TDI and TDO.

ID Registers (32 bits)

The ID Register is 32 bits wide and is encoded as follows:

Device	Revision Number (31:28)	Part Number (27:12)	Sony ID (11:1)	Start Bit (0)
128K x 36	xxxx	0000 0000 0010 0001	0000 1110 001	1
256K x 18	xxxx	0000 0000 0010 0010	0000 1110 001	1

Boundary Scan Register (70 bits for 128Kx36, 51 bits for 256Kx18)

The Boundary Scan Register contains the following bits:

128K x 36		256K x 18	
DQ	36	DQ	18
SA	17	SA	18
SW, SBW _x	5	SW, SBW _x	3
SS, \bar{G}	2	SS, \bar{G}	2
K, \bar{K} , C, \bar{C}	4	K, \bar{K} , C, \bar{C}	4
ZZ	1	ZZ	1
M1, M2	2	M1, M2	2
Place Holder	3	Place Holder	3

K/ \bar{K} , C/ \bar{C} inputs are sampled through one differential stage and inverted internally to generate internal K/ \bar{K} , C/ \bar{C} signals for scan registers. Place Holders are required for some NC pins to allow for future density upgrades, and are connected to V_{SS} internally regardless of pin connection externally.
