## MAX1791 Evaluation Kit

### General Description

The MAX1791 evaluation kit (EV kit) demonstrates a standard 2A application circuit. This DC-DC converter steps down high-voltage batteries and/or AC adapters, generating a precision, low-voltage rail for use as chipset, I/O, and other low-voltage supplies in notebook computers and PDAs.

The MAX1791 EV kit provides a 3.3V output voltage from a +5V to +20V battery input range. It delivers up to 2A output current with greater than 90% efficiency. The EV kit operates at 300kHz switching frequency and has superior line- and load-transient response.

This EV kit is a fully assembled and tested circuit board. It also allows the evaluation of other output voltages in the 1.25V to 5.5V range by changing feedback resistors R1 and R2. This EV kit can also be used to evaluate the MAX1762 (1.8V or 2.5V output voltage).

# MAX1791 Evaluation Kit

## Quick Start

The MAX1791 EV kit is a fully assembled and tested surface-mount board. Follow the steps below to verify board operation. **Do not turn on the power supply until all connections are completed:**

- 1) Connect a voltmeter and load (if any) to the VOUT pad.
- 2) Verify that the shunts are across JU1 pins 1 and 2 and JU2 pins 2 and 3.
- 3) Connect a +5V to +20V supply to the pads marked VIN and GND.
- 4) Turn on the power and verify that the output voltage is 3.3V.
- 5) See the *Output Voltage Selection* section to modify the board for a different output voltage.

## Detailed Description

### Jumper Selections

The MAX1791 EV kit features a shutdown mode that reduces quiescent current to less than 5 $\mu$ A to preserve battery life.

### Output Voltage Selection

The MAX1791 is initially set for a 3.3V output by connecting the FB pin to GND or 5V by connecting the FB pin to VL. However, by adding external resistors R1 and R2, the output can be adjustable from 1.25V to 5.5V. Remove the shunt from jumper JU2, and install output voltage-divider resistors R1 and R2. Refer to the *Setting the Output Voltage* section of the MAX1791 data sheet regarding how to extend the output voltage range from 0.5V to 5.5V and instructions on how to calculate the values for R1 and R2.

**Table 1. Jumper JU1 Functions (Shutdown Mode)**

SHUNT LOCATION	$\overline{\text{SHDN}}$ PIN	MAX1791 OUTPUT
1, 2	Connected to VIN	MAX1791 enabled, V <sub>OUT</sub> = 3.3V
2, 3	Connected to GND	Shutdown mode, V <sub>OUT</sub> = 0

**Table 2. Jumper JU2 Functions (Output Voltage)**

SHUNT LOCATION	FB PIN	OUTPUT VOLTAGE
1, 2	Connected to VL	V <sub>OUT</sub> = 5.0V
2, 3	Connected to GND	V <sub>OUT</sub> = 3.3V
