

# SCAN182245A

## Non-Inverting Transceiver with 25Ω Series Resistor Outputs

### General Description

The SCAN182245A is a high performance BiCMOS bidirectional line driver featuring separate data inputs organized into dual 9-bit bytes with byte-oriented output enable and direction control signals. This device is compliant with IEEE 1149.1 Standard Test Access Port and Boundary Scan Architecture with the incorporation of the defined boundary-scan test logic and test access port consisting of Test Data Input (TDI), Test Data Out (TDO), Test Mode Select (TMS), and Test Clock (TCK).

### Features

- High performance BiCMOS technology
- 25Ω series resistors in outputs eliminate the need for external terminating resistors
- Dual output enable control signals
- 3-STATE outputs for bus-oriented applications
- 25 mil pitch SSOP (Shrink Small Outline Package)
- IEEE 1149.1 (JTAG) Compliant
- Includes CLAMP, IDCODE and HIGHZ instructions
- Additional instructions SAMPLE-IN, SAMPLE-OUT and EXTEST-OUT
- Power Up 3-STATE for hot insert
- Member of Fairchild's SCAN Products

### Ordering Code:

Order Number	Package Number	Package Description
SCAN182245ASSC	MS56A	56-Lead Shrink Small Outline Package (SSOP), JEDEC MO-118, 0.300 Wide
SCAN182245AMTD	MTD56	56-Lead Thin Shrink Small Outline Package (TSSOP), JEDEC MO-153, 6.1mm Wide

Devices also available in Tape and Reel. Specify by appending the suffix letter "X" to the ordering code.

### Connection Diagram

### Pin Descriptions

Pin Names	Description
A1 <sub>(0-8)</sub>	Side A1 Inputs or 3-STATE Outputs
B1 <sub>(0-8)</sub>	Side B1 Inputs or 3-STATE Outputs
A2 <sub>(0-8)</sub>	Side A2 Inputs or 3-STATE Outputs
B2 <sub>(0-8)</sub>	Side B2 Inputs or 3-STATE Outputs
G1, G2	Output Enable Pins (Active LOW)
DIR1, DIR2	Direction of Data Flow Pins

### Truth Tables

Inputs		A1(0-8)	B1(0-8)
G1 (Note 1)	DIR1		
L	L	H ← H	
L	L	L ← L	
L	H	H → H	
L	H	L → L	
H	X	Z	Z

Inputs		A2(0-8)	B2(0-8)
G2 (Note 1)	DIR2		
L	L	H ← H	
L	L	L ← L	
L	H	H → H	
L	H	L → L	
H	X	Z	Z

H = HIGH Voltage Level  
L = LOW Voltage Level

X = Immaterial  
Z = High Impedance

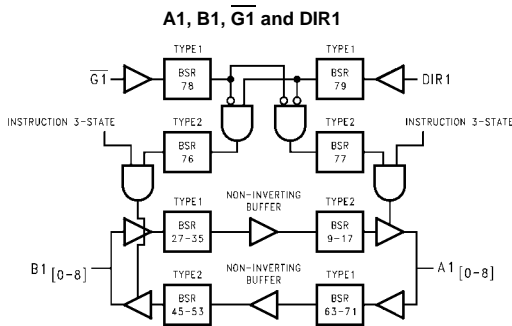

**Note 1:** Inactive-to-Active transition must occur to enable outputs upon power-up.

### Functional Description

The SCAN182245A consists of two sets of nine non-inverting bidirectional buffers with 3-STATE outputs and is intended for bus-oriented applications. Direction pins (DIR1 and DIR2) LOW enables data from B Ports to A Ports,

when HIGH enables data from A Ports to B Ports. The Output Enable pins (G1 and G2) when HIGH disables both A and B Ports by placing them in a high impedance condition.

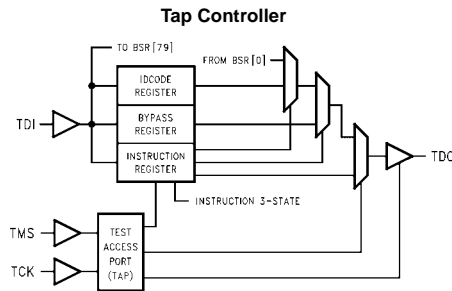

### Block Diagrams

**Note:** BSR stands for Boundary Scan Register.

**Note:** BSR stands for Boundary Scan Register.

## Description of BOUNDARY-SCAN Circuitry

The scan cells used in the BOUNDARY-SCAN register are one of the following two types depending upon their location. Scan cell TYPE1 is intended to solely observe system data, while TYPE2 has the additional ability to control system data.

Scan cell TYPE1 is located on each system input pin while scan cell TYPE2 is located at each system output pin as well as at each of the two internal active-high output enable signals. AOE controls the activity of the A-outputs while BOE controls the activity of the B-outputs. Each will activate their respective outputs by loading a logic high.

The BYPASS register is a single bit shift register stage identical to scan cell TYPE1. It captures a fixed logic low.

The INSTRUCTION register is an 8-bit register which captures the default value of 10000001 (SAMPLE/PRELOAD) during the CAPTURE-IR instruction command. The benefit of capturing SAMPLE/PRELOAD as the default instruction during CAPTURE-IR is that the user is no longer required to shift in the 8-bit instruction for SAMPLE/PRELOAD. The sequence of: CAPTURE-IR → EXIT1-IR → UPDATE-IR will update the SAMPLE/PRELOAD instruction. For more information refer to the section on instruction definitions.

### Bypass Register Scan Chain Definition

### SCAN182245A Product IDCODE (32-Bit Code per IEEE 1149.1)

Version	Entity	Part Number	Manufacturer ID	Required by 1149.1
0000	111111	0000000000	00000001111	1
<b>MSB</b>				<b>MSB</b>

### Instruction Register Scan Chain Definition

MSB → LSB

Instruction Code	Instruction
00000000	EXTEST
10000001	SAMPLE/PRELOAD
10000010	CLAMP
00000011	HIGH-Z
01000001	SAMPLE-IN
01000010	SAMPLE-OUT
00100010	EXTEST-OUT
10101010	IDCODE
11111111	BYPASS
All Others	BYPASS

## SCAN ABT Live Insertion and Power Cycling Characteristics

SCAN ABT is intended to serve in Live Insertion backplane applications. It provides 2nd Level Isolation<sup>1</sup> which indicates that while external circuitry to control the output enable pin is unnecessary, there may be a need to implement differential length backplane connector pins for V<sub>CC</sub> and GND. As well, pre-bias circuitry for backplane pins may be necessary to avoid capacitive loading effects during live insertion.

SCAN ABT provides control of output enable pins during power cycling via the circuit in Figure 1. It essentially controls the  $\overline{G}_n$  pin until V<sub>CC</sub> reaches a known level.

During *power-up*, when V<sub>CC</sub> ramps through the 0.0V to 0.7V range, all internal device circuitry is inactive, leaving output and I/O pins of the device in high impedance. From approximately 0.8V to 1.8V V<sub>CC</sub>, the Power-On-Reset circuitry, (POR), in Figure 1 becomes active and maintains device high impedance mode. The POR does this by providing a low from its output that resets the flip-flop. The output,  $\overline{Q}$ , of the flip-flop then goes high and disables the NOR gate from an incidental low input on the  $\overline{G}_n$  pin. After 1.8V V<sub>CC</sub>, the POR circuitry becomes inactive and ceases to

control the flip-flop. To bring the device out of high impedance, the  $\overline{G}_n$  input must receive an inactive-to-active transition, a high-to-low transition on  $\overline{G}_n$  in this case to change the state of the flip-flop. With a low on the  $\overline{Q}$  output of the flip-flop, the NOR gate is free to allow propagation of a  $\overline{G}_n$  signal.

During *power-down*, the Power-On-Reset circuitry will become active and reset the flip-flop at approximately 1.8V V<sub>CC</sub>. Again, the  $\overline{Q}$  output of the flip-flop returns to a high and disables the NOR gate from inputs from the  $\overline{G}_n$  pin. The device will then remain in high impedance for the remaining ramp down from 1.8V to 0.0V V<sub>CC</sub>.

Some suggestions to help the designer with live insertion issues:

- The  $\overline{G}_n$  pin can float during power-up until the Power-On-Reset circuitry becomes inactive.
- The  $\overline{G}_n$  pin can float on power-down only after the Power-On-Reset has become active.

The description of the functionality of the Power-On-Reset circuitry can best be described in the diagram of Figure 2.

### Absolute Maximum Ratings (Note 2)

Storage Temperature	-65°C to +150°C
Ambient Temperature under Bias	-55°C to +125°C
Junction Temperature under Bias	-55°C to +150°C
V <sub>CC</sub> Pin Potential to Ground Pin	-0.5V to +7.0V
Input Voltage (Note 3)	-0.5V to +7.0V
Input Current (Note 3)	-30 mA to +5.0 mA
Voltage Applied to Any Output in the Disabled or Power-Off State	-0.5V to +5.5V
in the HIGH State	-0.5V to V <sub>CC</sub>
Current Applied to Output in LOW State (Max)	Twice the Rated I <sub>OL</sub> (mA)
DC Latchup Source Current	-500 mA
Over Voltage Latchup (I/O)	10V
ESD (HBM) Min.	2000V

### Recommended Operating Conditions

Free Air Ambient Temperature	-40°C to +85°C
Supply Voltage	+4.5V to +5.5V
Minimum Input Edge Rate	( $\Delta V/\Delta t$ )
Data Input	50 mV/ns
Enable Input	20 mV/ns

**Note 2:** Absolute maximum ratings are values beyond which the device may be damaged or have its useful life impaired. Functional operation under these conditions is not implied.

**Note 3:** Either voltage limit or current limit is sufficient to protect inputs.
