Note: 1. The output current maximum value  $I_{ospnmax}$  of SPN driver is controlled according to the following equation. However,  $V_{spncl}$  is the current limiter reference voltage. (See the electrical characteristics)

$$I_{ospnmax} = \frac{V_{spncl}}{R_{nf}}$$

2. The maximum duty  $D_{max}$  of SLD driver output is controlled according to the following equation.

$$D_{max} = \frac{V_{rt}}{V_{hct3} - V_{lct3}} \left( \frac{R_{t2}}{R_t} - \frac{V_{lct3}}{V_{rt}} \right) \times 100 (\%)$$

However,

$$R_t = R_{t1} + R_{t2}, \quad \frac{R_{t2}}{R_t} \geq \frac{V_{lct3}}{V_{rt}}$$

Where,  $V_{rt}$  : RT pin voltage (See the electrical characteristics)

$V_{lct3}$  : CT3 pin low voltage ( $\approx 1.3$  V)

$V_{hct3}$  : CT3 pin high voltage ( $\approx 3.3$  V)

Since  $V_{rt} \approx V_{hct3}$ ,  $D_{max}$  is not limited at 100% when  $R_{t1} = 0 \Omega$ .

3. The CLK oscillation frequency is determined by the following equation.

$$f_{clk} = \frac{V_{rt}}{8 C_{t1} R_t \Delta V_{ct1}}$$

Where,  $V_{rt}$  : RT pin voltage (See the electrical characteristics)

$\Delta V_{ct1}$  : CT1 pin voltage amplitude ( $\approx 1$  V)

4. The  $C_{t2}$  for start-up oscillation is determined by the following equation.

$$T_{c2} = \frac{1}{6} \sqrt{\frac{J}{P K_t I_{spnmax}}}$$

$$C_{t2} = \frac{T_{c2} V_{rt}}{8 R_t (V_{hct2} - V_{lct2})}$$

Where,  $J$  : Spindle motor inertia ( $\text{kg} \cdot \text{cm} \cdot \text{S}^2$ )

$P$  : Number of spindle motor poles (Total number of S poles and N poles)

$K_t$  : Spindle motor torque constant ( $\text{kg} \cdot \text{cm} / \text{A}$ )

$V_{hct2}$  : CT2 pin high voltage ( $\approx 3.3$  V)

$V_{lct2}$  : CT2 pin low voltage ( $\approx 1.3$  V)

5. The PWM oscillation frequency  $f_{pwm}$  is determined by the following equation.

$$f_{pwm} = \frac{V_{rt}}{8 C_{t3} R_t (V_{hct3} - V_{lct3})}$$

Where,  $V_{hct3}$  : CT3 pin high voltage ( $\approx 3.3$  V)

$V_{lct3}$  : CT3 pin low voltage ( $\approx 1.3$  V)

6. The C103 to C105 for B-EMF filter are determined by the following equation.

$$\frac{21}{\pi \cdot R_{flt} \cdot N_o \cdot P} \leq C_{103} \leq \frac{35}{\pi \cdot R_{flt} \cdot N_o \cdot P}$$

Where,  $R_{flt}$  : B-EMF detection output resistor (See the electrical characteristics)

$N_o$  : Maximum rotation speed (rpm)

7. The FCS and TRR is determined by the following equation.

Voltage drive:

$$G_v = \frac{R_1}{R_{in} + R_2}$$

Current drive:

$$G_m = \frac{R_1}{((R_{in} + R_2) \cdot R_s)}$$

Where,  $R_1$  : Resistor of IC inside ( $\approx 30k\Omega$ )

$R_2$  : Resistor of IC inside ( $\approx 7k\Omega$ )

$R_{in}$  : Resistor value inserted in the input ( $\Omega$ )  
(R110 to R113)

$R_s$  : Current sense resistor ( $\Omega$ )

8. The output voltage  $V_{out}$  of voltage regulator is determined by the following equation.

$$V_{out} = 3.3 \left( 1 + \frac{R_{r1}}{R_{r2}} \right)$$
