

## PIN CONFIGURATION

## PIN DESCRIPTION

NAME	FUNCTION	NAME	FUNCTION
TX <sub>IN+</sub> , TX <sub>IN-</sub>	These differential ECL100K compatible inputs receive NRZ data from the PHY for transmission.	SD <sub>+</sub> , SD <sub>-</sub>	These differential ECL100K compatible outputs indicate the presence of a data signal with an amplitude exceeding a preset threshold.
TPOUT <sub>+</sub> , TPOUT <sub>-</sub>	Outputs from the NRZ buffer drive these differential current outputs. The transmitter filter/transformer module connects the media to these pins.	TPIN <sub>+</sub> , TPIN <sub>-</sub>	NRZ encoded data from the receiver filter/transformer module enters the Receiver through these pins.
LPBK	This TTL input enables transmitter-Receiver loopback internally when asserted low.	RXOUT <sub>+</sub> , RXOUT <sub>-</sub>	Differential ECL100K compatible outputs provide NRZ encoded data to the PHY.
TXOFF	This TTL input forces the NRZ driver to a high impedance state when asserted low and shuts off transmit bias current.	RRSET1, RRSET2	Internal time constants controlling the equalizer's transfer function are set by an external resistor connected across these pins.
RTSET1, RTSET2	An external 1% resistor connected between these pins controls the transmitter output current amplitude. $I_{OUT} = 32 \times 1.25V/RTSET$	CMREF	This pin provides a DC common mode reference point for the receiver inputs.
TVCCA, TVCCD	Separate analog and digital transmitter power supply pins help to isolate sensitive circuitry from noise generating digital functions. Both supplies are nominally +5 volts.	RVCCA, RVCCD	Analog and digital supply pins are separated to isolate clean and noisy circuit functions. Both supplies are nominally +5 volts.
TGND, TGND	Analog and digital transmitter grounds provide separate return paths for clean and noisy signals.	RGND	Receiver ground.

## ABSOLUTE MAXIMUM RATINGS

Absolute maximum ratings are limits beyond which the life of the integrated circuit may be impaired. All voltages unless otherwise specified are measured with respect to ground.

V <sub>CC</sub> Supply Voltage Range	GND –0.3V to 6V
Input Voltage Range	
Digital Inputs	GND –0.3V to V <sub>CC</sub> + 0.3V
Output Current	
TPOUT+/TPOUT–, SD±, RXOUT±	50mA
All other outputs	10mA
Junction Temperature	150°C

Storage Temperature	–65°C to 150°C
Lead Temperature (Soldering, 10 sec)	260°C
Thermal Resistance ( $\theta_{JA}$ )	
PLCC	60°C/W
TQFP	80°C/W

## OPERATING CONDITIONS

V <sub>CC</sub> Supply Voltage	5V ± 5%
T <sub>A</sub> , Ambient Temperature	0°C to 70°C
RTSET	2k $\Omega$ ± 1%
RRSET	9.53k $\Omega$ ± 1%
Receive transformer insertion loss	< –0.5dB

## ELECTRICAL CHARACTERISTICS

Unless otherwise specified, T<sub>A</sub> = T<sub>MIN</sub> to T<sub>MAX</sub>, V<sub>CC</sub> = 5V ± 5%, RTSET = 2.0k $\Omega$ . (Note 1)

PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS

TPOUT+, TPOUT– Differential Output Current HIGH	V <sub>OUT</sub> = V <sub>CC</sub> ± 0.5, Note 2	19.0		21.0	mA

## ELECTRICAL CHARACTERISTICS (CONTINUED)

PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS
<b>Differential Outputs</b> (SD±, RXOUT±, TPOUT±) (Continued)					
TPOUT+, TPOUT– Differential Output Current LOW	$V_{OUT} = V_{CC} \pm 0.5$ , Note 2	0		0.1	mA
TPOUT+, TPOUT– Output Current Offset				0.5	mA
TPOUT+, TPOUT– $V_{OUT} = V_{CC}$ Output Amplitude Error	Note 2	–5.0		5.0	%
TPOUT+, TPOUT– $V_{OUT} = V_{CC} \pm 1.1V$ Output Voltage Compliance		–2.0		+2.0	%
<b>AC Characteristics</b>					
TPOUT+, TPOUT– Rise/Fall Time		1.5	2.0	2.5	ns
TPOUT+, TPOUT– Output Jitter			0.5		ns
RXOUT+, RXOUT– Rise/Fall Time				5	ns
RXOUT+, RXOUT– Output Jitter			2.0		ns

**Note 1.** Limits are guaranteed by 100% testing, sampling, or correlation with worst-case test conditions.

**Note 2.** Output current amplitude is determined by  $I_{OUT} = 32 \times 1.25V/RTSET$ .

**Note 3.** Output voltage levels are specified when terminated by  $50\Omega$  to  $V_{CC}-2V$  or equivalent load.

## FUNCTIONAL DESCRIPTION

The ML6674 transceiver is a physical media dependent transceiver that allows the transmission and reception of 155 Mbps data over 100 meters over shielded twisted pair cable or category 5 unshielded twisted pair cable.

The transmit section accepts NRZ data, sending the information on a two pin current driven transmitter. The transmitted output passes through an external low pass filter and transformer before entering the connectors to the STP or UTP cable. The output amplitude of the transmitted signal is programmable through the external RTSET resistor.

The receive section accepts NRZ coded data after it passes through an isolation transformer and band limiting filter. The adaptive equalizer is used to compensate for the amplitude and phase distortion incurred from the cable. The adaptive control section determines the signal amplitude (and therefore the cable length) and adjusts the equalizer accordingly. As the input signal amplitude diminishes, the amount of equalization increases until it reaches its maximum (Figure 1).

The receiver also includes the Baseline Wander correction circuitry. The circuit will compensate and track the DC baseline wander caused by DC imbalance of the received data. A 10pF capacitor can be connected between TPIN+ and TPIN- to improve Bit Error Rate.

The adaptive control block governs both the equalization level as well as the signal detection status. Signal detect is asserted when the equalizer control loop settles, or when loop back is asserted. When the input signal is small, the equalization will be at its maximum.

After the signal has been equalized, it is fed through the loopback multiplexer onto the RXOUT± pins.

Figure 1 shows a typical gain vs frequency plot of the adaptive equalizer for 0, 25, 50, 75 and 100 meter category 5 cable lengths.

### TRANSMISSION

PECL level scrambled NRZ data is received by the ML6674 and the current driven transmitter then sent the data to the filter/transformer module. The transmit amplitude is controlled by one external resistor, RTSET.

$$I_{OUT} = \frac{32 \times 1.25V}{RTSET}$$

For ATM UTP applications the transmit amplitude is 1V peak to peak. The termination at the transmitter output is 50Ω. Therefore the transmit current  $I_{OUT} = 1/50 = 20$  mA. Thus,

$$RTSET = \frac{32 \times 1.25V}{20mA} = 2k\Omega$$

The transmitter may be disabled via the TXOFF pin. When this pin is pulled low, the transmitter's output goes to a

high impedance state and no current flows through the transformer.

### ADAPTIVE EQUALIZATION

During transmission of data over UTP (unshielded twisted pair), distortion and ISI are caused by dispersion in the cable. Equalization is used to overcome this signal corruption. However, the distortion is frequency dependent and cable length dependent. Therefore, in most practical cases, the TP port characteristic is unknown and it is impractical to tune the equalizer specifically to each individual port. Hence, adaptive equalizer is used in the TP-PMD to ensure proper compensation of the received signal.

By using adaptive equalizer, the receiver automatically compensates different length of cable without over equalizing or under equalizing the line. The ML6674 monitors the amplitude of the received signal to determine the cable length and adjust the equalizer accordingly. The input signal level is inversely proportional to the cable length. Therefore, as the signal level decreases, the amount of equalization is increased to compensate for the line loss.

### ML6672 COMPATIBILITY

The ML6674 implements the Baseline Wander correction circuit, in addition to providing the functionality of the existing ML6672 device. The ML6674 is plug-compatible with the ML6672 with the following notes:

- In the ML6674 design, the RTSET resistor must be 2.0kΩ
- In the ML6674 design, the following passive components used in the ML6672 design may be eliminated from the ML6674 design
  - RSET resistor
  - RTH resistor
  - CAP1 capacitor
  - CAP2 capacitor

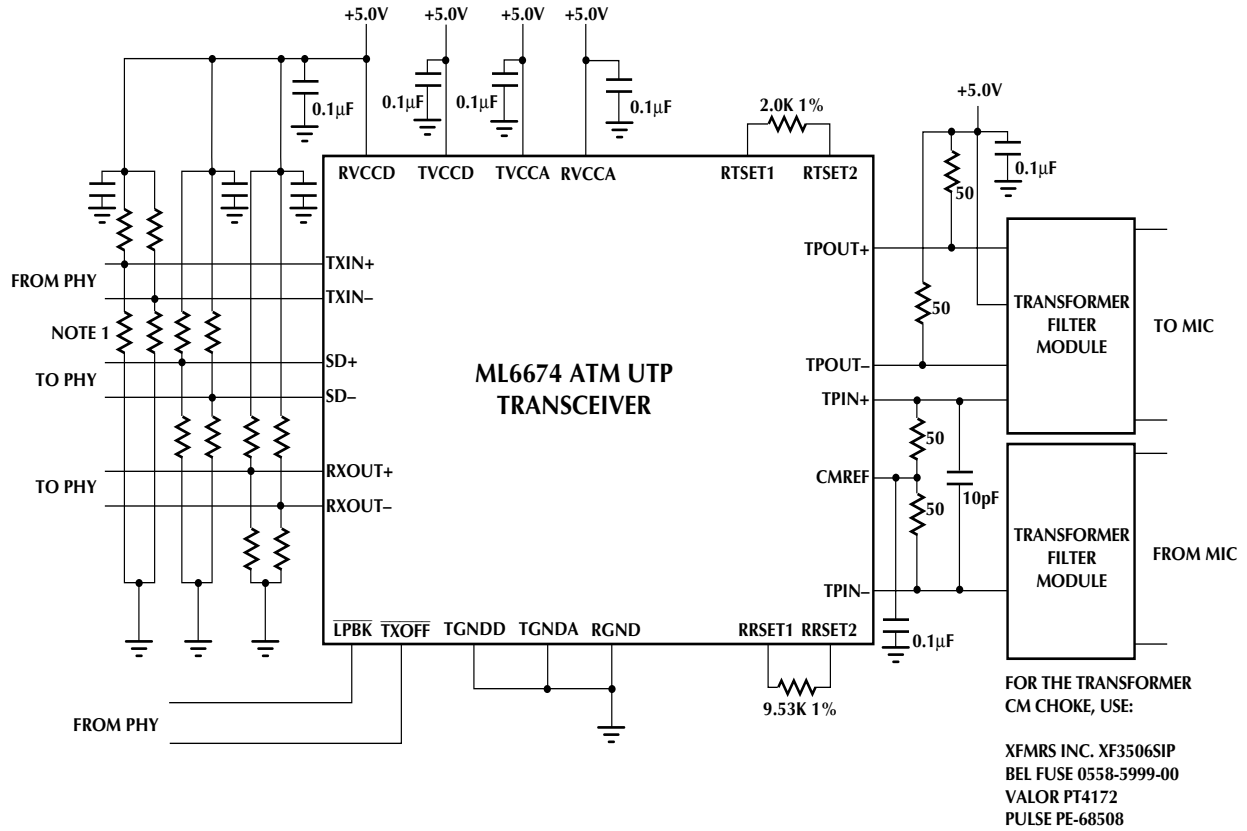

Figure 1. Equalization Range

## Application Example of ML6674 Configured for 1.0V<sub>p-p</sub> Transmit Amplitude on C5 UTP.

- Note 1.** Split 100K ECL terminations are 82Ω and 130Ω to VCC and GND respectively.
- Note 2.** Recommended power supply bypass capacitors are 0.1µF with optional 10µF tantalum in parallel.
- Note 3.** Transformer turns ratio is 1:1.
- Note 4.** LPBK and TXOFF inputs are active LOW.
