## F<sup>2</sup>MC-16F MB90F244

### MB90F244

#### ■ DESCRIPTION

The MB90F244 is a 16-bit microcontroller optimized for applications in mechatronics such as HDD units. The architecture of the MB90F244 is based on the MB90242A, and embedded with a 128-Kbyte flash memory.

The instruction set is based on the AT architecture of the F<sup>2</sup>MC\* family, with additional high-level language supporting instruction, expanded addressing modes, enhanced multiplication and division instructions, and improved bit processing instructions. In addition, long-word data can now be processed due to the inclusion of a 32-bit accumulator.

The MB90F244 includes a variety of peripherals on chip, such as the device is equipped with 8-channel 8/10-bit A/D converter, UART, 3-channel 16-bit reload timers, 1-channel 16-bit timer, 4-channel 16-bit input capture and 4-channel DTP/external interrupts.

Differences between the MB90F244 and MB90F243 to meet the 3.3 V  $\pm$ 0.3 V power supply voltage are that the power consumption of the MB90F244 is about 10% less than that of the MB90F243 and the operating frequency of the MB90F244 is up to 50 MHz from 32 MHz of the MB90F243.

\* : F<sup>2</sup>MC stands for FUJITSU Flexible Microcontroller.

#### ■ PACKAGE

80-pin Plastic TQFP

(FPT-80P-M15)

## ■ FEATURES

- Minimum execution time (target): 40.0 ns at 50 MHz oscillation (3.3 V  $\pm$ 0.3 V)
- Instruction set optimized for controller applications
  - Variety of data types: bit, byte, word, long-word
  - Expanded addressing modes: 25 types
  - High coding efficiency
  - Improvement of high-precision arithmetic operations through use of 32-bit accumulator
  - Enhanced multiplication and division instructions (signed arithmetic operations)
- Instruction set supports high-level language (C language) and multitasking
  - Inclusion of system stack pointer
  - Variety of pointers
  - High instruction set symmetry
  - Barrel shift instruction
  - Stack check function
- Improved execution speed: 8-byte queue
- Powerful interrupt functions
  - Interrupt processing time: 0.64  $\mu$ s at 50 MHz oscillation
  - Priority levels: 8 levels (programmable)
  - External interrupt inputs: 4 channels
- Automatic transfer function independent of CPU
  - Extended intelligent I/O service: Max.15 channels
- 128-Kbyte flash memory
  - Access time (min.) : 80 ns
  - Sector structure of 16K + 512  $\times$  2 + 7K + 8K + 32K + 64K
  - Program/erase operations from both EPROM programmer and CPU through built-in flash memory interface circuit
  - Built-in programming booster circuit for flash memory
- Internal RAM: 1.152 kbyte
  - According to mode settings, data stored on RAM can be executed as CPU instructions.
- General-purpose ports: Max. 63 channels (single-chip mode)  
Max. 38 channels (external bus mode)
- 18-bit timebase timer
- Watchdog timer
- UART: 8 bits  $\times$  1 channel
- 8/16-bit I/O simple serial interface (max. 12.5 Mbps): 1 channel
- 8/10-bit A/D converter: Analog inputs: 8 channels
  - Resolution: 10 bits (switchable to 8 bits/10 bits)
  - Conversion time: Min. 1  $\mu$ s
  - Conversion result store register: 4 channels
- 16-bit I/O timer
  - 16-bit free-run timer: 1 channel (operating clock: 0.16  $\mu$ s)
  - 16-bit input capture: 4 channels
- 16-bit reload timer: 3 channels
- Low-power consumption modes
  - Sleep mode
  - Stop mode
  - Hardware standby mode
- Packages: TQFP-80 (FPT-80P-M15)  
(For more information about the package, see section “■ Package Dimensions.”)

## ■ PIN DESCRIPTION

Pin no. TQFP-80*	Pin name	Circuit type	Function
62	X0	A	Crystal oscillator pins (50 MHz)
63	X1		
39 to 41	MD0 to MD2	C	Operating mode selection input pins Connect directly to V <sub>CC5</sub> or V <sub>SS</sub> . In the flash memory mode, these pins are set to be V <sub>ID</sub> (= 12.0 V) input pins by performing a proper operation.
60	$\overline{\text{RST}}$	B	External reset request input pin
42	$\overline{\text{HST}}$	D	Hardware standby input pin
65 to 72	P00 to P07	E	General-purpose I/O port
	D00 to D07		I/O pins for the lower 8 bits of the external data bus
	DQ0 to DQ7		Data I/O pins for each operation command This function is valid in the flash memory mode.
73 to 80	P10 to P17	E	General-purpose I/O port This function is valid when the external bus 8-bit mode.
	D08 to D15		I/O pins for the upper 8 bits of the external data bus This function is valid when 16-bit bus mode.
	DQ8 to DQ15		Data I/O pins for each operation command This function is valid in the flash memory mode.
1 to 8	P20 to P27	F	General-purpose I/O port
	A00 to A07		Output pins for the medium 8 bits of the external address bus
	AQ0 to AQ7		Address input pins for each operation command This function is valid in the flash memory mode.
10 to 17	P30 to P37	F	General-purpose I/O port This function is valid when the corresponding bit of the middle address control register specification is "port".
	A08 to A15		Output pins for the medium 8 bits of the external address bus This function is valid when the corresponding bit of the middle address control register specification is "port".
	AQ8 to AQ15		Address input pins for each operation command This function is valid in the flash memory mode.
18	P40	F	General-purpose I/O port This function is valid when the corresponding bit of the upper address control register specification is "port".
	A16		External address bus output pin of the bit 16 This function is valid when the corresponding bit of the upper address control register specification is "address".
	AQ16		Address input pin for each operation command This function is valid in the flash memory mode.

Type	Circuit	Remarks
I	 <p>The circuit diagram for Type I shows a square-wave input connected to a diffusion resistor. The other end of the resistor is connected to the gate of an N-channel MOSFET. The drain of the MOSFET is connected to a pull-up resistor and is labeled 'Digital output'. The source of the MOSFET is connected to ground. The input signal is also connected to an 'Analog input' terminal. A 'Digital input control' signal is connected to the gate of a CMOS inverter, which is also connected to the input signal through a buffer. The output of this inverter is connected to the gate of another CMOS inverter, which is also connected to the input signal through a buffer. ## ■ HANDLING DEVICES

### 1. Preventing Latchup

Latchup may occur on CMOS ICs if voltage higher than  $V_{CC}$  or lower than  $V_{SS}$  is applied to the input or output pins other than medium-and high-voltage pins or if higher than the voltage which shown on “1. Absolute Maximum Ratings” in section “■ Electrical Characteristics” is applied between  $V_{CC}$  and  $V_{SS}$ .

When latchup occurs, power supply current increases rapidly might thermally damage elements. When using, take great care not to exceed the absolute maximum ratings.

In addition, for the same reasons take care to prevent the analog power supply from exceeding the digital power supply.

### 2. Treatment of Unused Pins

Leaving unused input pins open could cause malfunctions. They should be connected to a pull-up or pull-down resistors.

### 3. Precautions when Using an External Clock

When an external clock is used, drive X0 only.

- For example an external clock

### 4. Power Supply Pins

When there are several  $V_{CC}$  and  $V_{SS}$  pins, those pins that should have the same electric potential are connected within the device when the device is designed in order to prevent misoperation, such as latch-up. However, all of those pins must be connected to the power supply and ground externally in order to reduce unnecessary emissions, prevent misoperation of strobe signals due to an increase in the ground level, and to observe the total output current standards.

In addition, give a due consideration to the connection in that current supply be connected to  $V_{CC}$  and  $V_{SS}$  with the lowest possible impedance.

Finally, it is recommended to connect a capacitor of about  $0.1 \mu\text{F}$  between  $V_{CC}$  and  $V_{SS}$  near this device as a bypass capacitor.

## 5. Crystal Oscillation Circuit

Noise in the vicinity of the X0 and X1 pins will cause this device to operate incorrectly. Design the printed circuit board so that the bypass capacitor connecting X0 and X1 pins and the crystal oscillator (or ceramic oscillator) to ground is located as close to the device as possible.

In addition, because printed circuit board artwork in which the area around the X0 and X1 pins is surrounded by ground provides stable operation, such an arrangement is strongly recommended.

## 6. Sequence for Applying the A/D Converter Power Supply and the Analog Inputs

Always be sure to apply the digital power supply ( $V_{CC}$ ) before applying the A/D converter power supply ( $AV_{CC}$ ,  $AV_{RH}$ , and  $AV_{RL}$ ) and the analog inputs (AN0 to AN7).

In addition, when the power is turned off, turn off the A/D converter power supply and the analog inputs first, and then turn off the digital power supply. (Turning on or off the analog and digital power supplies simultaneously will not cause any problems.)

Whether applying or cutting off the power, be certain that  $AV_{RH}$  does not exceed  $AV_{CC}$ .

## 7. External Reset Input

To reliably reset the controller by inputting an “L” level to the  $\overline{RST}$  pin, ensure that the “L” level is applied for at least five machine cycles.

## 8. $\overline{HST}$ Pin

When turning on the system, be sure to set the  $\overline{HST}$  pin to “H” level. Never set the  $\overline{HST}$  pin to “L” level while the  $\overline{RST}$  pin is in “L” level.

## 9. CLK Pin

Note: CLK pin cannot use as I/O port.  
Care must be taken that this is different from standard specification for F<sup>2</sup>MC-16F family.

## 10. Specified Interrupt Sequence

When the interrupt stack area is allocated to the external memory, even if the higher priority level interrupt may generate while the former interrupt is waiting in the stack area, the latter higher priority level interrupt routine has to wait until the former interrupt routine is executed. In this case the former interrupt routine is executed in the latter higher priority level.

**Explanation of read/write**

R/W : Readable and writable

R : Read only

W : Write only

**Explanation of initial values**

0 : The initial value of this bit is "0".

1 : The initial value of this bit is "1".

X : The initial value of this bit is undefined.

– : This bit is unused. No initial value is defined.

\*1: Access prohibited.

\*2: The initial values are changed depending on a bus mode.

\*3: The only area available for the external access below address 0000FF<sub>H</sub> is this area. Addresses not explained in the table are "(reserved area)"; accesses to these areas are handled accesses to internal areas. No access signal is generated for the external bus.

Note: Do not use any "(vacancy)".

	$V_{CC5}$	$V_{SS} - 0.3$	$V_{SS} + 7.0$	V	*1
	$AV_{CC}$	$V_{SS} - 0.3$	$V_{SS} + 4.0$	V	*2
	$AV_{RH}$	$V_{SS} - 0.3$	$V_{SS} + 4.0$	V	*2
	$AV_{RL}$	$V_{SS} - 0.3$	$V_{SS} + 4.0$	V	*2
Input voltage	$V_{I1}$	$V_{SS} - 0.3$	$V_{CC} + 0.3$	V	*3
	$V_{I2}$	$V_{SS} - 0.3$	$V_{CC5} + 0.3$	V	*4
Output voltage	$V_O$	$V_{SS} - 0.3$	$V_{CC} + 0.3$	V	*3
"L" level maximum output current	$I_{OL}$	—	10	mA	
"L" level average output current	$I_{OLAV}$	—	3	mA	
"L" level total maximum output current	$\Sigma I_{OL}$	—	60	mA	
"L" level total average output current	$\Sigma I_{OLAV}$	—	30	mA	
"H" level maximum output current	$I_{OH}$	—	-10	mA	
"H" level average output current	$I_{OHAV}$	—	-3	mA

Power consumption	$P_D$	—	350	mW	
Operating temperature	$T_A$	0	+70	°C	
Storage temperature	$T_{stg}$	-55	+125	°C	

\*1:  $V_{CC5}$  must always exceed  $V_{CC}$ .

\*2:  $AV_{CC}$ ,  $AV_{RH}$  and  $AV_{RL}$  must not exceed  $V_{CC}$ . Also  $AV_{RL}$  must not exceed  $AV_{RH}$ .

\*3:  $V_{I1}$  and  $V_O$  must not exceed  $V_{CC} + 0.3\text{ V}$ .

\*4:  $V_{I2}$  must not exceed  $V_{CC5} + 0.3\text{ V}$ .

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

## 2. Recommended Operating Conditions

( $A_{V_{SS}} = V_{SS} = 0.0 \text{ V}$ )

Parameter	Symbol	Value		Unit	Remarks
		Min.	Max.		
Power supply voltage	$V_{CC}$	3.0	3.6	V	Normal operation
	$V_{CC}$	3.0	3.6	V	Maintaining the stop status
	$V_{CC5}$	4.5	5.5	V	
Operating temperature	$T_A$	0	+70	°C	

**WARNING:** The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representatives beforehand.

## (4) Power-on Reset

( $V_{SS} = V_{SS} = 0.0\text{ V}$ ,  $T_A = 0^\circ\text{C}$  to  $+70^\circ\text{C}$ )

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
Power supply rising time	$t_R$	$V_{CC}, V_{CC5}$	—	—	30	ms	*
Power supply cut-off time	$t_{OFF}$	$V_{CC}, V_{CC5}$	—	1	—	ms	

\* : Before the power supply rising,  $V_{CC}$  must be lower than 0.2 V.

Note: The above standards are the values needed in order to activate a power-on reset.

If power supply voltage needs to be changed in the course of operation, a smooth voltage rise is recommended by suppressing the voltage variation as shown below.

\*1: When  $F_c = 50\text{ MHz}$  (frequency), and the machine cycle is  $4.0\text{ ns}$ .

The minimum value of the ADCT resistor is #A224, differs from that of the MB90F243.

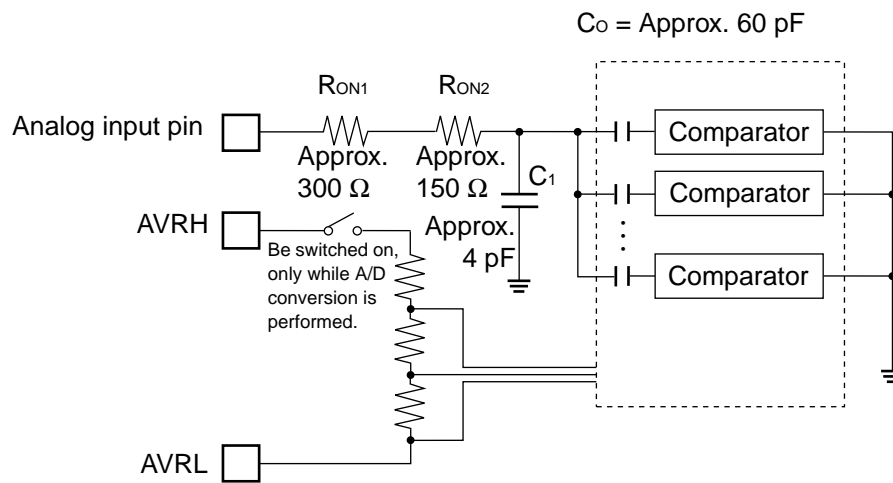

\*2: Current when the A/D converter is not operating and the CPU is stopped.

Notes: • The smaller  $|AVRH - AVRL|$ , the greater the error would become relatively.

- If the output impedance of the external circuit for the analog input is high, sampling period might be insufficient. When the sampling period set at near the minimum value, the output impedance of the external circuit should be less than approximately  $300\ \Omega$ .

• Analog input circuit model diagram

Note: Use the values shows as reference only.

## 6. A/D Converter Glossary

- **Resolution**

Analog changes that are identifiable with the A/D converter.  
When the number of bits is 10, analog voltage can be divide into  $2^{10}$ .

- **Linearity error (unit: LSB)**

The deviation of the straight line connecting the zero transition point (“00 0000 0000” ↔ “00 0000 0001”) with the full-scale transition point (“11 1111 1110” ↔ “11 1111 1111”) from actual conversion characteristics

- **Differential linearity error**

The deviation of input voltage needed to change the output code by 1 LSB from the theoretical value

- **Total error (unit: LSB)**

The difference between theoretical and actual conversion values caused by the zero transition error, full-scale transition error, non-linearity error, differential linearity error, and noise

## ■ INSTRUCTIONS (412 INSTRUCTIONS)

**Table 1 Explanation of Items in Table of Instructions**

Item	Explanation
Mnemonic	Upper-case letters and symbols: Represented as they appear in assembler Lower-case letters: Replaced when described in assembler. Numbers after lower-case letters: Indicate the bit width within the instruction.
#	Indicates the number of bytes.
~	Indicates the number of cycles. See Table 4 for details about meanings of letters in items.
B	Indicates the correction value for calculating the number of actual cycles during execution of instruction. The number of actual cycles during execution of instruction is summed with the value in the "cycles" column.
Operation	Indicates operation of instruction.
LH	Indicates special operations involving the bits 15 through 08 of the accumulator. Z: Transfers "0". X: Extends before transferring. —: Transfers nothing.
AH	Indicates special operations involving the high-order 16 bits in the accumulator. *: Transfers from AL to AH. —: No transfer. Z: Transfers 00 <sub>H</sub> to AH. X: Transfers 00 <sub>H</sub> or FF <sub>H</sub> to AH by extending AL.
I	Indicates the status of each of the following flags: I (interrupt enable), S (stack), T (sticky bit), N (negative), Z (zero), V (overflow), and C (carry). *: Changes due to execution of instruction. —: No change. S: Set by execution of instruction. R: Reset by execution of instruction.
S	
T	
N	
Z	
V	
C	
RMW	Indicates whether the instruction is a read-modify-write instruction (a single instruction that reads data from memory, etc., processes the data, and then writes the result to memory). *: Instruction is a read-modify-write instruction —: Instruction is not a read-modify-write instruction Note: Cannot be used for addresses that have different meanings depending on whether they are read or written.

- \*1: 3 when dividing into zero, 8 or 18 when an overflow occurs, and 18 normally.
- \*2: 3 when dividing into zero, 10 or 21 when an overflow occurs, and 22 normally.
- \*3: 4 + (a) when dividing into zero, 11 + (a) or 22 + (a) when an overflow occurs, and 23 + (a) normally.
- \*4: When the dividend is positive: 4 when dividing into zero, 10 or 29 when an overflow occurs, and 30 normally.  
When the dividend is negative: 4 when dividing into zero, 11 or 30 when an overflow occurs, and 31 normally.
- \*5: When the dividend is positive: 4 + (a) when dividing into zero, 11 + (a) or 30 + (a) when an overflow occurs, and 31 + (a) normally.  
When the dividend is negative: 4 + (a) when dividing into zero, 12 + (a) or 31 + (a) when an overflow occurs, and 32 + (a) normally.
- \*6: (b) when dividing into zero or when an overflow occurs, and 2 × (b) normally.
- \*7: (c) when dividing into zero or when an overflow occurs, and 2 × (c) normally.
- \*8: 3 when byte (AH) is zero, 12 when the result is positive, and 13 when the result is negative.

The contents of this document are subject to change without notice. Customers are advised to consult with FUJITSU sales representatives before ordering.

The information and circuit diagrams in this document are presented as examples of semiconductor device applications, and are not intended to be incorporated in devices for actual use. Also, FUJITSU is unable to assume responsibility for infringement of any patent rights or other rights of third parties arising from the use of this information or circuit diagrams.

The products described in this document are designed, developed and manufactured as contemplated for general use, including without limitation, ordinary industrial use, general office use, personal use, and household use, but are not designed, developed and manufactured as contemplated (1) for use accompanying fatal risks or dangers that, unless extremely high safety is secured, could have a serious effect to the public, and could lead directly to death, personal injury, severe physical damage or other loss (i.e., nuclear reaction control in nuclear facility, aircraft flight control, air traffic control, mass transport control, medical life support system, missile launch control in weapon system), or (2) for use requiring extremely high reliability (i.e., submersible repeater and artificial satellite).

Please note that Fujitsu will not be liable against you and/or any third party for any claims or damages arising in connection with above-mentioned uses of the products.

Any semiconductor devices have an inherent chance of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Law of Japan, the prior authorization by Japanese government will be required for export of those products from Japan.
