

**DESCRIPTION**

The M52761 is IF signal-processing IC for VCRs and TVs. It enable the PLL detection system despite size as small as that of conventional quasi-synchronous VIF/SIF detector, IF/RF AGC, SIF limiter, FM detector, QIF AGC and EQ AMP.

**FEATURES**

- Video detection output is 2V<sub>P-P</sub>. It has built-in EQ AMP.
- The video detector uses PLL for full synchronous detection circuit. It produces excellent characteristics of DG, DP, 920kHz beat, and cross color.
- Dynamic AGC realizes high speed response with double filter.
- Video IF and sound IF signal processings are separated from each other. VCO output is used to obtain intercarrier. This PLL-SPLIT method and built-in QIF AGC provide good sound sensitivity and reduces buzz.
- As AFT output voltage uses the APC output voltage, VCO coil is not used.
- Audio FM demodulation uses PLL system, so it has wide frequency range with no external parts and no adjustment.
- This IC corresponds to only NTSC system.

**PIN CONFIGURATION (TOP VIEW)**

Outline 20P4B (SP)  
20P2N-A (FP)

**APPLICATION**

TV sets, VCR tuners

**RECOMMENDED OPERATING CONDITION**

In case of Vcc and Vreg. out short

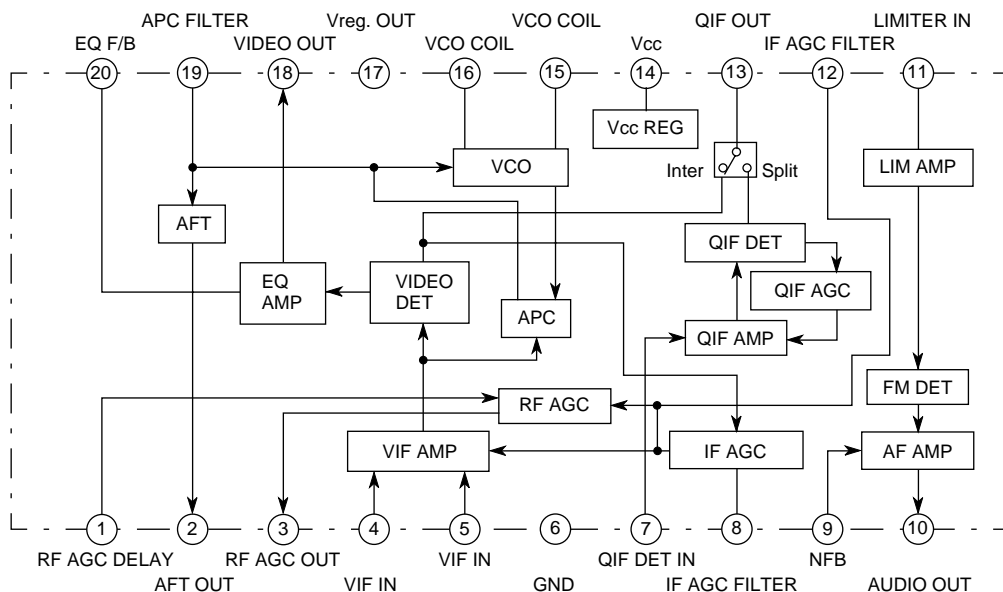

Supply voltage range.....4.75 to 5.25V

Recommended supply voltage.....5.0V

In case of Vreg. out open

Supply voltage range.....8.5 to 12.5V

**BLOCK DIAGRAM**

**mitsubishi ICs (TV)**

**ELECTRICAL CHARACTERISTICS TEST METHOD**

**Video S/N**

Input SG2 into VIF IN and measure the video out (Pin 18) noise in r.m.s at TP18B through a 5MHz (-3dB) L.P.F.

$$S/N=20 \log \left( \frac{0.7 \times V_o \text{ det}}{\text{NOISE}} \right) (\text{dB})$$

**BW Video band width**

1. Measure the 1MHz component level of EQ output TP18A with a spectrum analyzer when SG3 (f2=57.75MHz) is input into VIF IN. At that time, measure the voltage at TP8 with SW8, set to position 2, and then fix V8 at that voltage.
2. Reduce f2 and measure the value of (f2-f0) when the (f2-f0) component level reaches -3dB from the 1MHz component level as shown below.

**VIN MIN Input sensitivity**

Input SG4 (Vi=90dBμ) into VIF IN, and then gradually reduce Vi and measure the input level when the 20kHz component of EQ output TP18A reaches -3dB from Vo det level.

**VIN MAX Maximum allowable input**

1. Input SG5 (Vi=90dBμ) into VIF IN, and measure the level of the 20kHz component of EQ output.
2. Gradually increase the Vi of SG and measure the input level when the output reaches -3dB.

**GR AGC Control range**

$$GR=VIN \text{ MAX}-VIN \text{ MIN} (\text{dB})$$

**V3 RF AGC operating voltage**

Input SG8 into VIF IN and gradually reduce Vi and then measure the input level when RF AGC output TP3 reaches 1/2 Vcc, as shown below.

**CL-U Capture range**

1. Increase the frequency of SG9 until the VCO is out of locked-oscillation.
2. Decrease the frequency of SG9 and measure the frequency fU when the VCO locks.  
 $CL-U=fU-58.75$  (MHz)

**CL-L Capture range**

1. Decrease the frequency of SG9 until the VCO is out of locked-oscillation.
2. Increase the frequency of SG9 and measure the frequency fL when the VCO locks.  
 $CL-L=58.75-fL$  (MHz)

**CL-T Capture range**

$CL-T=CL-U+CL-L$  (MHz)

**VCO Δf VCO SW on drift**

1. Input SG2 into VIF IN .
2. Turn on SW14 (Vcc), and adjust VCO coil so that AFT OUT voltage TP2 equal 1/2 Vcc in 10 seconds.
3. Put VIF IN input in a non-input state and ground AGC filter at TP8.
4. Measure the VCO free-run frequency 10 seconds after SW ON (f1), and one minutes after (f2).  
 $VCO \Delta f$  (kHz) =f2 (MHz) -f1 (MHz)

**μ AFT sensitivity, V2H Maximum AFT voltage, V2L Minimum AFT voltage**

1. Input SG10 into VIF IN , and set the frequency of SG10 so that the voltage of AFT output TP19 is 6V. This frequency is named f (6).
2. Set the frequency of SG10 so that the AFT output voltage is 3V. This frequency is named f (3)
3. IN the graph, maximum and minimum DC voltage are V2H and V2L, respectively.

$$\mu = \frac{1000 \text{ (mV)}}{f(3) - f(6) \text{ (kHz)}} \text{ (mV/kHz)}$$

**IM Intermodulation**

1. Input SG11 into VIF IN, and measure EQ output TP18A with an oscilloscope.
2. Adjust AGC filter voltage V8 so that the minimum DC level of the output waveform is 1.0V.
3. At this time, measure TP18A with a spectrum analyzer .  
 The intermodulation is defined as a difference between 0.92MHz and 3.58MHz frequency components.

**LIM Limiting sensitivity**

1. Input SG17 (Vi=90dBμ) into SIF input, and measure the 400Hz component level of AF output TP10.
2. Input SG19 (Vi=90dBμ) into SIF input, and measure the 400Hz component level of AF output TP10.
3. Measure the input level of SG17 and SG19 when a ratio of the two VoAF level is 30dB. This input level is named VIN MIN.

**AMR AM rejection**

1. Input SG18 into SIF input, and measure the output level of AF output TP10. This level is named VAM.
2. AMR is;

$$AMR=20\log \left( \frac{VoAF \text{ (mVr.m.s)}}{VAM \text{ (mVr.m.s)}} \right) \text{ (dB)}$$

**AF S/N**

1. Input SG19 into SIF input, and measure the output noise level of AF output TP10. This level is named VN.
2. S/N is;

$$S/N=20\log \left( \frac{VoAF \text{ (mVr.m.s)}}{VN \text{ (mVr.m.s)}} \right) \text{ (dB)}$$

**CQIF QIF control**

Decrease the voltage of V7, and measure V7 when the DC voltage of TP13 changes.

**THE NOTE IN THE SYSTEM SETUP**

M52761FP has 2 power supply pins of Vcc (pin 14) and Vreg.OUT (pin 17) .

Pin 14 is for AFT output, RF AGC output circuits and 5V regulated power supply circuit and Pin 17 is for the other circuit blocks.

In case M52761FP is used together with other ICs like VIF operating at more than 5V, the same supply voltage as that of connected ICs is applied to Vcc and Vreg.Out is opened. The other circuit blocks, connected to Vreg.OUT are powered by internal 5V regulated power supply.

In case the connecting ICs are operated at 5V, 5V is supplied to both Vcc and Vreg.OUT.

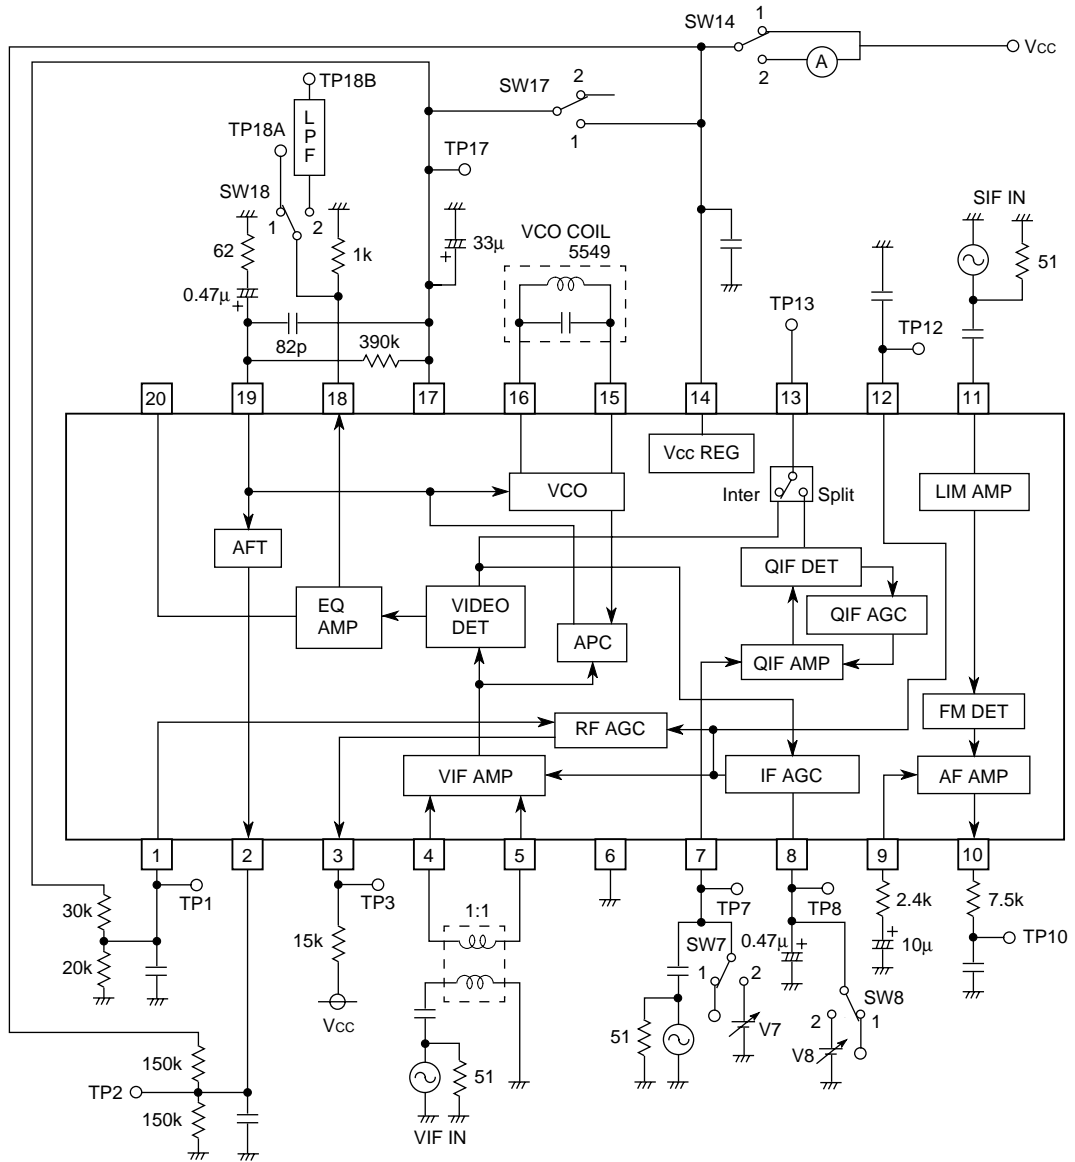

**INPUT SIGNAL**
