

8-Pin, 8-Bit CMOS Microcontroller with A/D Converter

Devices included in this Data Sheet:

PIC12C671 and PIC12C672 are 8-bit microcontrollers with 8-bit A/D Converter packaged in 8-lead packages. They are based on the 14-bit PIC16/17 architecture.

High-Performance RISC CPU:

- · Only 35 single word instructions to learn
- All instructions are single cycle (1 μs) except for program branches which are two-cycle
- Operating speed: DC 10 MHz clock input DC - 1 μs instruction cycle

Device	EPROM	RAM
PIC12C671	1024 x 14	128 x 8
PIC12C672	2048 x 14	128 x 8

- 14-bit wide instructions
- 8-bit wide data path
- · Interrupt capability
- · Special function hardware registers
- · Eight-level deep hardware stack
- Direct, indirect and relative addressing modes for data and instructions
- Internal 4 MHz oscillator with programmable calibration
- · Selectable clockout
- In-circuit serial programming
- · 4-channel 8-bit analog-to-digital converter

Peripheral Features:

- 8-bit real time clock/counter (TMR0) with 8-bit programmable prescaler
- Power-On Reset (POR)
- Power-up Timer (PWRT) and Oscillator Start-up Timer (OSC)
- Watchdog Timer (WDT) with its own on-chip RC oscillator for reliable operation
- · Programmable code-protection
- · Power saving SLEEP mode
- Interrupt on pin change (GP0, GP1, GP3)
- Internal pull-ups on I/O pins (GP0, GP1, GP3)

- · Selectable oscillator options:
 - INTRC: Precision internal 4 MHz oscillator
 - EXTRC: External low-cost RC oscillator
 - XT: Standard crystal/resonator
 - HS: High speed crystal/resonator
 - LP: Power saving, low frequency crystal
- Internal pull-up on MCLR pin

CMOS Technology:

- Low power, high speed CMOS EPROM technology
- Fully static design
- Wide operating voltage range:
 - Commercial: 2.5V to 5.5V
 - Industrial: 2.5V to 5.5V
 - Extended: 4.5V to 5.5V
- Low power consumption
 - < 2 mA @ 5V, 4 MHz
 - 15 μA typical @ 3V, 32 KHz
 - < 1 μA typical standby current

To Our Valued Customers

We constantly strive to improve the quality of all our products and documentation. We have spent an exceptional amount of time to ensure that these documents are correct. However, we realize that we may have missed a few things. If you find any information that is missing or appears in error, please use the reader response form in the back of this data sheet to inform us. We appreciate your assistance in making this a better document.

1.0 GENERAL DESCRIPTION

The PIC12C67X device is a low-cost, high-performance, CMOS, fully-static, 8-bit microcontroller with integrated analog-to-digital (A/D) converter, in the PIC12CXXX Microcontroller family.

All PIC16/17 microcontrollers employ an advanced RISC architecture. The PIC12C67X microcontrollers have enhanced core features, eight-level deep stack, and multiple internal and external interrupt sources. The separate instruction and data buses of the Harvard architecture allow a 14-bit wide instruction word with the separate 8-bit wide data. The two stage instruction pipeline allows all instructions to execute in a single cycle, except for program branches which require two cycles. A total of 35 instructions (reduced instruction set) are available. Additionally, a large register set gives some of the architectural innovations used to achieve a very high performance.

PIC12C67X microcontrollers typically achieve a 2:1 code compression and a 4:1 speed improvement over other 8-bit microcontrollers in their class.

The PIC12C67X devices have 128 bytes of RAM and 6 I/O pins. In addition a timer/counter is available. Also a 4-channel high-speed 8-bit A/D is provided. The 8-bit resolution is ideally suited for applications requiring low-cost analog interface, e.g. thermostat control, pressure sensing, etc.

The PIC12C67X device has special features to reduce external components, thus reducing cost, enhancing system reliability and reducing power consumption. The PIC12C67X products are equipped with special features that reduce system cost and power requirements. The Power-On Reset (POR), Power-up Timer (PWRT), and Oscillator Start-up Timer (OST) eliminate the need for external reset circuitry. There are five oscillator configurations to choose from, including INTRC precision internal oscillator mode and the power-saving LP (Low Power) oscillator. Power saving SLEEP mode. Watchdog Timer and code protection features improve system cost, power and reliability. The SLEEP (powerdown) feature provides a power saving mode. The user can wake up the chip from SLEEP through several external and internal interrupts and resets.

A highly reliable Watchdog Timer with its own on-chip RC oscillator provides protection against software lock-up.

A UV erasable windowed package version is ideal for code development while the cost-effective One-Time-Programmable (OTP) version is suitable for production in any volume. The customer can take full advantage of Microchip's price leadership in OTP microcontrollers while benefiting from the OTP's flexibility.

The PIC12C67X device fits perfectly in applications ranging from security and remote sensors to appliance control and automotive. The EPROM technology makes customization of application programs (transmitter codes, motor speeds, receiver frequencies, etc.) extremely fast and convenient. The small footprint packages make this microcontroller series perfect for all applications with space limitations. Low cost, low power, high performance, ease of use and I/O flexibility make the PIC12C67X very versatile even in areas where no microcontroller use has been considered before (e.g. timer functions, communications and coprocessor applications).

1.1 Family and Upward Compatibility

The PIC12C67X products are compatible with other members of the PIC16CXXX family.

1.2 <u>Development Support</u>

The PIC12C67X device is supported by a full-featured macro assembler, a software simulator, an in-circuit emulator, a low-cost development programmer and a full-featured programmer. A "C" compiler and fuzzy logic support tools are also available.

TABLE 1-1: PIC12CXXX FAMILY OF DEVICES

		PIC12C508	PIC12C509	PIC12C671	PIC12C672
Clock	Maximum Frequency of Operation (MHz)	4	4	10	10
Memory	EPROM Program Memory	512 x 12	1024 x 12	1024 x 14	2048 x 14
Welliory	Data Memory (bytes)	25	41	128	128
Peripherals	Timer Module(s)	TMR0	TMR0	TMR0	TMR0

	Interrupt Sources	_	_	4	4
	I/O Pins	5	5	5	5
	Input Pins	1	1	1	1
Features	Internal Pull-ups	Yes	Yes	Yes	Yes
	Voltage Range (Volts)	2.5-5.5	2.5-5.5	2.5-5.5	2.5-5.5
	In-Circuit Serial Programming	Yes	Yes	Yes	Yes
	Number of Instructions	33	33	35	35
	Packages	8-pin DIP, JW, SOIC	8-pin DIP, JW, SOIC	8-pin DIP, JW, SOIC	8-pin DIP, JW, SOIC

All PIC12CXXX devices have Power-on Reset, selectable Watchdog Timer, selectable code protect and high I/O current capability. All PIC12CXXX devices use serial programming with data pin GP0 and clock pin GP1.

2.0 PIC12C67X DEVICE VARIETIES

A variety of frequency ranges and packaging options are available. Depending on application and production requirements, the proper device option can be selected using the information in the PIC12C67X Product Identification System section at the end of this data sheet. When placing orders, please use that page of the data sheet to specify the correct part number.

For the PIC12C67X, there are two device "types" as indicated in the device number:

- C, as in PIC12C671. These devices have EPROM type memory and operate over the standard voltage range.
- LC, as in PIC12LC671. These devices have EPROM type memory and operate over an extended voltage range.

2.1 UV Erasable Devices

The UV erasable version, offered in windowed package, is optimal for prototype development and pilot programs.

The UV erasable version can be erased and reprogrammed to any of the configuration modes. Microchip's PICSTART® Plus and PRO MATE® programmers both support the PIC12C67X. Third party programmers also are available; refer to the Microchip Third Party Guide for a list of sources.

CAUTION: Calibration values must be read before erasing.

2.2 <u>One-Time-Programmable (OTP)</u> <u>Devices</u>

The availability of OTP devices is especially useful for customers who need the flexibility for frequent code updates and small volume applications.

The OTP devices, packaged in plastic packages, permit the user to program them once. In addition to the program memory, the configuration bits must also be programmed.

2.3 Quick-Turnaround-Production (QTP) Devices

Microchip offers a QTP Programming Service for factory production orders. This service is made available for users who choose not to program a medium to high quantity of units and whose code patterns have stabilized. The devices are identical to the OTP devices but with all EPROM locations and configuration options already programmed by the factory. Certain code and prototype verification procedures apply before production shipments are available. Please contact your local Microchip Technology sales office for more details.

2.4 <u>Serialized Quick-Turnaround</u> Production (SQTPSM) Devices

Microchip offers a unique programming service where a few user-defined locations in each device are programmed with different serial numbers. The serial numbers may be random, pseudo-random, or sequential.

Serial programming allows each device to have a unique number which can serve as an entry-code, password, or ID number.

NOTES:

3.0 ARCHITECTURAL OVERVIEW

The high performance of the PIC12C67X family can be attributed to a number of architectural features commonly found in RISC microprocessors. To begin with, the PIC12C67X uses a Harvard architecture, in which program and data are accessed from separate memories using separate buses. This improves bandwidth over traditional von Neumann architecture in which program and data are fetched from the same memory using the same bus. Separating program and data buses also allow instructions to be sized differently than the 8-bit wide data word. Instruction opcodes are 14bits wide making it possible to have all single word instructions. A 14-bit wide program memory access bus fetches a 14-bit instruction in a single cycle. A twostage pipeline overlaps fetch and execution of instructions (Example 3-1). Consequently, all instructions (35) execute in a single cycle (1 µs @ 4 MHz) except for program branches.

The table below lists program memory (EPROM) and data memory (RAM) for each PIC12C67X device.

Device	Program Memory	Data Memory
PIC12C671	1K x 14	128 x 8
PIC12C672	2K x 14	128 x 8

The PIC12C67X can directly or indirectly address its register files or data memory. All special function registers, including the program counter, are mapped in the data memory. The PIC12C67X has an orthogonal (symmetrical) instruction set that makes it possible to carry out any operation on any register using any addressing mode. This symmetrical nature and lack of 'special optimal situations' make programming with the PIC12C67X simple yet efficient. In addition, the learning curve is reduced significantly.

PIC12C67X devices contain an 8-bit ALU and working register. The ALU is a general purpose arithmetic unit. It performs arithmetic and Boolean functions between the data in the working register and any register file.

The ALU is 8-bits wide and capable of addition, subtraction, shift and logical operations. Unless otherwise mentioned, arithmetic operations are two's complement in nature. In two-operand instructions, typically one operand is the working register (W register). The other operand is a file register or an immediate constant. In single operand instructions, the operand is either the W register or a file register.

The W register is an 8-bit working register used for ALU operations. It is not an addressable register.

Depending on the instruction executed, the ALU may affect the values of the Carry (C), Digit Carry (DC), and Zero (Z) bits in the STATUS register. The C and DC bits operate as a $\overline{\text{borrow}}$ bit and a $\overline{\text{digit}}$ $\overline{\text{borrow}}$ out bit, respectively, in subtraction. See the SUBLW and SUBWF instructions for examples.

FIGURE 3-1: PIC12C67X BLOCK DIAGRAM

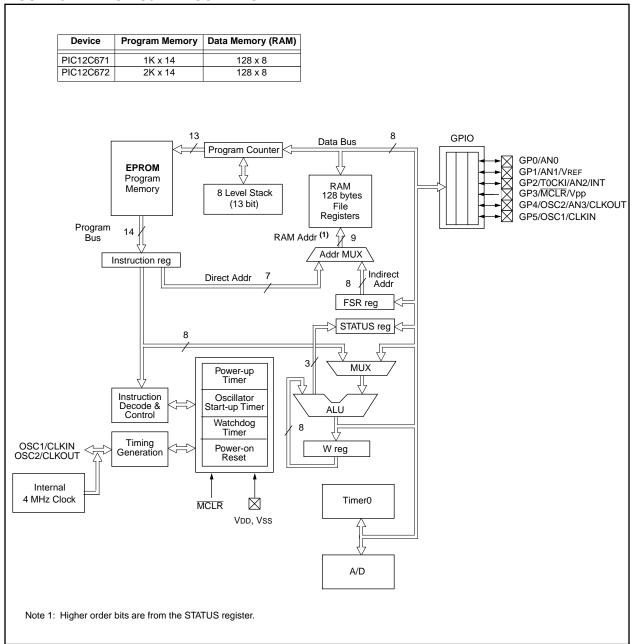

TABLE 3-1: PIC12C67X PINOUT DESCRIPTION

Name	DIP Pin#	SOIC Pin#	I/O/P Type	Buffer Type	Description
GP0/AN0	7	7	I/O	TTL/ST	Bi-directional I/O port/serial programming data/analog input 0. Can be software programmed for internal weak pull-up and interrupt on pin change. This buffer is a Schmitt Trigger input when used in serial programming mode.
GP1/AN1/VREF	6	6	I/O	TTL/ST	Bi-directional I/O port/serial programming clock/analog input 1/voltage reference. Can be software programmed for internal weak pull-up and interrupt on pin change. This buffer is a Schmitt Trigger input when used in serial programming mode.
GP2/T0CKI/AN2/INT	5	5	I/O	ST	Bi-directional I/O port/analog input 2. Can be configured as T0CKI or external interrupt.
GP3/MCLR/VPP	4	4	I	TTL	Input port/master clear (reset) input/programming voltage input. When configured as \overline{MCLR} , this pin is an active low reset to the device. Voltage on \overline{MCLR}/VPP must not exceed VDD during normal device operation. Can be software programmed for internal weak pull-up and interrupt on pin change. Weak pull-up always on if configured as \overline{MCLR} .
GP4/OSC2/AN3/ CLKOUT	3	3	I/O	TTL	Bi-directional I/O port/oscillator crystal output/analog input 3. Connections to crystal or resonator in crystal oscillator mode (XT and LP modes only, GPIO in other modes). In EXTRC and INTRC modes, the pin output can be configured to CLKOUT which has 1/4 the frequency of OSC1 and denotes the instruction cycle rate.
GP5/OSC1/CLKIN	2	2	I/O	TTL/ST	Bidirectional IO port oscillator crystal input/external clock source input (GPIO in INTRC mode only, OSC1 in all other oscillator modes). Schmitt trigger in EXTRC mode only.
VDD	1	1	Р	_	Positive supply for logic and I/O pins
Vss	8	8	Р	_	Ground reference for logic and I/O pins

 $\label{eq:lower} \mbox{Legend: I = input, O = output, I/O = input/output, P = power, --- = not used, TTL = TTL input, ST = Schmitt Trigger input}$

3.1 **Clocking Scheme/Instruction Cycle**

The clock input (from OSC1) is internally divided by four to generate four non-overlapping quadrature clocks namely Q1, Q2, Q3 and Q4. Internally, the program counter (PC) is incremented every Q1, the instruction is fetched from the program memory and latched into the instruction register in Q4. The instruction is decoded and executed during the following Q1 through Q4. The clocks and instruction execution flow is shown in Figure 3-2.

3.2 **Instruction Flow/Pipelining**

An "Instruction Cycle" consists of four Q cycles (Q1, Q2, Q3 and Q4). The instruction fetch and execute are pipelined such that fetch takes one instruction cycle while decode and execute takes another instruction cycle. However, due to the pipelining. each instruction effectively executes in one cycle. If an instruction causes the program counter to change (e.g. GOTO) then two cycles are required to complete the instruction (Example 3-1).

A fetch cycle begins with the program counter (PC) incrementing in Q1.

In the execution cycle, the fetched instruction is latched into the "Instruction Register" (IR) in cycle Q1. This instruction is then decoded and executed during the Q2, Q3, and Q4 cycles. Data memory is read during Q2 (operand read) and written during Q4 (destination write).

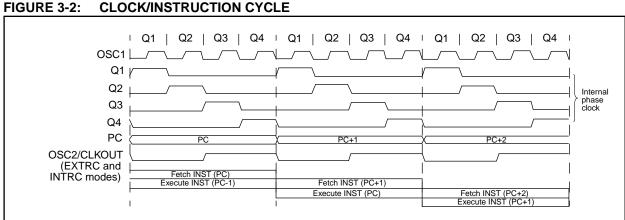

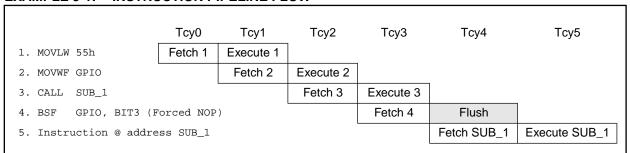

FIGURE 3-2:

EXAMPLE 3-1: INSTRUCTION PIPELINE FLOW

instructions are single cycle, except for any program branches. These take two cycles since the fetch truction is "flushed" from the pipeline while the new instruction is being fetched and then executed.

4.0 MEMORY ORGANIZATION

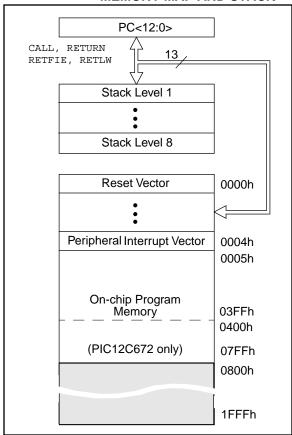

4.1 Program Memory Organization

The PIC12C67X has a 13-bit program counter capable of addressing an 8K x 14 program memory space.

For the PIC12C671 the first 1K \times 14 (0000h-03FFh) is implemented.

For the PIC12C672, the first 2K x 14 (0000h-07FFh) is implemented. Accessing a location above the physically implemented address will cause a wraparound. The reset vector is at 0000h and the interrupt vector is at 0004h.

FIGURE 4-1: PIC12C67X PROGRAM MEMORY MAP AND STACK

4.2 <u>Data Memory Organization</u>

The data memory is partitioned into two Banks which contain the General Purpose Registers and the Special Function Registers. Bit RP0 is the bank select bit.

RP0 (STATUS<5>) = $1 \rightarrow Bank 1$

RP0 (STATUS<5>) = $0 \rightarrow Bank 0$

Each Bank extends up to 7Fh (128 bytes). The lower locations of each Bank are reserved for the Special Function Registers. Above the Special Function Registers are General Purpose Registers implemented as static RAM. Both Bank 0 and Bank 1 contain special function registers. Some "high use" special function registers from Bank 0 are mirrored in Bank 1 for code reduction and quicker access.

Also note that F0h through FFh on the PIC12C67X is mapped into Bank 0 registers 70h-7Fh.

4.2.1 GENERAL PURPOSE REGISTER FILE

The register file can be accessed either directly, or indirectly through the File Select Register FSR (Section 4.5).

4.2.2 SPECIAL FUNCTION REGISTERS

The Special Function Registers are registers used by the CPU and Peripheral Modules for controlling the desired operation of the device. These registers are implemented as static RAM.

The special function registers can be classified into two sets (core and peripheral). Those registers associated with the "core" functions are described in this section, and those related to the operation of the peripheral features are described in the section of that peripheral feature.

TABLE 4-1: PIC12C67X SPECIAL FUNCTION REGISTER SUMMARY

Legend: x = unknown, u = unchanged, q = value depends on condition, - = unimplemented read as '0', r = reserved. Shaded locations are unimplemented, read as '0'.

Note 1: These registers can be addressed from either bank.

- 3: Other (non power-up) resets include external reset through MCLR and Watchdog Timer Reset.
- 4: The IRP and RP1 bits are reserved on the PIC12C67X, always maintain these bits clear.

^{2:} The upper byte of the program counter is not directly accessible. PCLATH is a holding register for the PC<12:8> whose contents are transferred to the upper byte of the program counter.

4.2.2.1 STATUS REGISTER

The STATUS register, shown in Figure 4-3, contains the arithmetic status of the ALU, the RESET status and the bank select bits for data memory.

The STATUS register can be the destination for any instruction, as with any other register. If the STATUS register is the destination for an instruction that affects the Z, DC or C bits, then the write to these three bits is disabled. These bits are set or cleared according to the device logic. Furthermore, the TO and PD bits are not writable. Therefore, the result of an instruction with the STATUS register as destination may be different than intended.

For example, CLRF STATUS will clear the upper-three bits and set the Z bit. This leaves the STATUS register as 000u uluu (where u = unchanged).

It is recommended, therefore, that only BCF, BSF, SWAPF and MOVWF instructions are used to alter the STATUS register because these instructions do not affect the Z, C or DC bits from the STATUS register. For other instructions, not affecting any status bits, see the "Instruction Set Summary."

- Note 1: Bits IRP and RP1 (STATUS<7:6>) are not used by the PIC12C67X and should be maintained clear. Use of these bits as general purpose R/W bits is NOT recommended, since this may affect upward compatibility with future products.
- Note 2: The C and DC bits operate as a borrow and digit borrow bit, respectively, in subtraction. See the SUBLW and SUBWF instructions for examples.

4.2.2.2 OPTION REGISTER

The OPTION register is a readable and writable register which contains various control bits to configure the TMR0/WDT prescaler, the External INT Interrupt, TMR0, and the weak pull-ups on GPIO.

Note: To achieve a 1:1 prescaler assignment for the TMR0 register, assign the prescaler to the Watchdog Timer by setting bit PSA (OPTION<3>).

FIGURE 4-4: OPTION REGISTER (ADDRESS 81h)

4.2.2.3 INTCON REGISTER

The INTCON Register is a readable and writable register which contains various enable and flag bits for the TMR0 register overflow, GPIO Port change and External GP2/INT Pin interrupts.

Interrupt flag bits get set when an interrupt condition occurs regardless of the state of its corresponding enable bit or the global enable bit, GIE (INTCON<7>).

FIGURE 4-5: INTCON REGISTER (ADDRESS 0Bh, 8Bh)

4.2.2.5 PIR1 REGISTER

This register contains the individual flag bits for the Peripheral interrupts.

Interrupt flag bits get set when an interrupt condition occurs regardless of the state of its corresponding enable bit or the global enable bit, GIE (INTCON<7>). User software should ensure the appropriate interrupt flag bits are clear prior to enabling an interrupt.

FIGURE 4-7: PIR1 REGISTER (ADDRESS 0Ch)

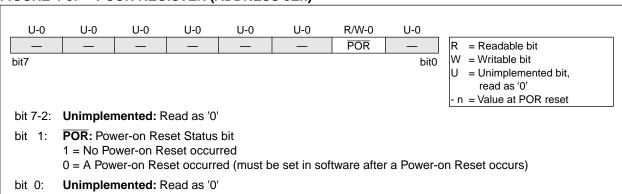

Note:

4.2.2.6 PCON REGISTER

The Power Control (PCON) register contains a flag bit to allow differentiation between a Power-on Reset (POR), an external MCLR Reset, and WDT Reset.

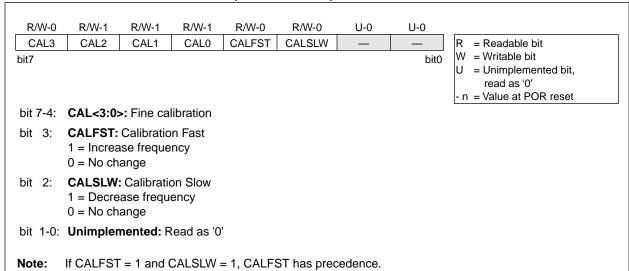

FIGURE 4-8: PCON REGISTER (ADDRESS 8Eh)

4.2.2.7 OSCCAL REGISTER

The Oscillator Calibration (OSCCAL) register is used to calibrate the internal 4 MHz oscillator. It contains four bits for fine calibration and two other bits to either increase or decrease frequency.

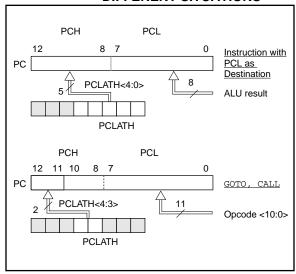

FIGURE 4-9: OSCCAL REGISTER (ADDRESS 8Fh)

4.3 PCL and PCLATH

The program counter (PC) is 13-bits wide. The low byte comes from the PCL register, which is a readable and writable register. The high byte (PC<12:8>) is not directly readable or writable and comes from PCLATH. On any reset, the PC is cleared. Figure 4-10 shows the two situations for the loading of the PC. The upper example in the figure shows how the PC is loaded on a write to PCL (PCLATH<4:0> \rightarrow PCH). The lower example in the figure shows how the PC is loaded during a CALL or GOTO instruction (PCLATH<4:3> \rightarrow PCH).

FIGURE 4-10: LOADING OF PC IN DIFFERENT SITUATIONS

4.3.1 COMPUTED GOTO

A computed GOTO is accomplished by adding an offset to the program counter (ADDWF PCL). When doing a table read using a computed GOTO method, care should be exercised if the table location crosses a PCL memory boundary (each 256 byte block). Refer to the application note "Implementing a Table Read" (AN556).

4.3.2 STACK

The PIC12C67X family has an 8 level deep x 13-bit wide hardware stack. The stack space is not part of either program or data space and the stack pointer is not readable or writable. The PC is PUSHed onto the stack when a CALL instruction is executed or an interrupt causes a branch. The stack is POPed in the event of a RETURN, RETLW or a RETFIE instruction execution. PCLATH is not affected by a PUSH or POP operation.

The stack operates as a circular buffer. This means that after the stack has been PUSHed eight times, the ninth push overwrites the value that was stored from the first push. The tenth push overwrites the second push (and so on).

- **Note 1:** There are no status bits to indicate stack overflow or stack underflow conditions.
- Note 2: There are no instructions/mnemonics called PUSH or POP. These are actions that occur from the execution of the CALL, RETURN, RETLW, and RETFIE instructions, or the vectoring to an interrupt address.

4.4 Program Memory Paging

The PIC12C67X ignores both paging bits PCLATH<4:3>, which are used to access program memory when more than one page is available. The use of PCLATH<4:3> as general purpose read/write bits for the PIC12C67X is not recommended since this may affect upward compatibility with future products.

4.5 <u>Indirect Addressing, INDF and FSR</u> Registers

The INDF register is not a physical register. Addressing the INDF register will cause indirect addressing.

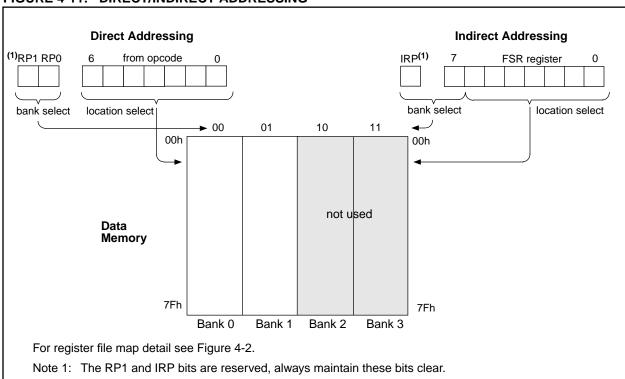

Indirect addressing is possible by using the INDF register. Any instruction using the INDF register actually accesses the register pointed to by the File Select Register, FSR. Reading the INDF register itself indirectly (FSR = '0') will read 00h. Writing to the INDF register indirectly results in a no-operation (although status bits may be affected). An effective 9-bit address is obtained by concatenating the 8-bit FSR register and the IRP bit (STATUS<7>), as shown in Figure 4-11. However, IRP is not used in the PIC12C67X.

A simple program to clear RAM locations 20h-2Fh using indirect addressing is shown in Example 4-1.

FIGURE 4-11: DIRECT/INDIRECT ADDRESSING

NOTES:

5.0 I/O PORT

As with any other register, the I/O register can be written and read under program control. However, read instructions (e.g., MOVF GPIO, W) always read the I/O pins independent of the pin's input/output modes. On RESET, all I/O ports are defined as input (inputs are at hi-impedance) since the I/O control registers are all set.

5.1 **GPIO**

GPIO is an 8-bit I/O register. Only the low order 6 bits are used (GP5:GP0). Bits 7 and 6 are unimplemented and read as '0's. Please note that GP3 is an input only pin. The configuration word can set several I/O's to alternate functions. When acting as alternate functions the pins will read as '0' during port read. Pins GP0, GP1, and GP3 can be configured with weak pull-ups and also with interrupt on change. The interrupt on change and weak pull-up functions are not pin selectable. If pin 4 is configured as MCLR, the weak pull-up is always on. Interrupt on change for this pin is not set and GP3 will read as '0'. Interrupt on change is enabled by setting INTCON<3>. Note that external oscillator use overrides the GPIO functions on GP4 and GP5.

5.2 TRIS Register

This register controls the data direction for GPIO. A '1' from a TRIS register bit puts the corresponding output driver in a hi-impedance mode. A '0' puts the contents of the output data latch on the selected pins, enabling the output buffer. The exceptions are GP3 which is input only and its TRIS bit will always read as '1'.

Note: A read of the ports reads the pins, not the output data latches. That is, if an output driver on a pin is enabled and driven high, but the external system is holding it low, a read of the port will indicate that the pin is

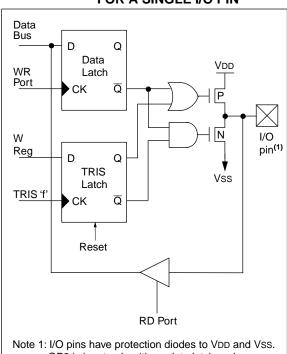

Upon reset, the TRIS register is all '1's, making all pins inputs.

5.3 **I/O Interfacing**

The equivalent circuit for an I/O port pin is shown in Figure 5-2. All port pins, except GP3 which is input only, may be used for both input and output operations. For input operations these ports are non-latching. Any input must be present until read by an input instruction (e.g., MOVF GPIO, W). The outputs are latched and remain unchanged until the output latch is rewritten. To use a port pin as output, the corresponding direction control bit in TRIS must be cleared (= 0). For use as an input, the corresponding TRIS bit must be set. Any I/O pin (except GP3) can be programmed individually as input or output.

Note: On a Power-on Reset, GP0, GP1, GP2, GP4 are configured as analog inputs and read as '0'.

FIGURE 5-1: EQUIVALENT CIRCUIT FOR A SINGLE I/O PIN

Note 1: I/O pins have protection diodes to VDD and Vss. GP3 is input only with no data latch and no output drivers.

TABLE 5-1: SUMMARY OF PORT REGISTERS

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Value on Power-on Reset	Value on all other Resets

Note 1: The IRP and RP1 bits are reserved on the PIC12C67X, always maintain these bits clear.

5.4 **I/O Programming Considerations**

5.4.1 BI-DIRECTIONAL I/O PORTS

Any instruction which writes, operates internally as a read followed by a write operation. The BCF and BSF instructions, for example, read the register into the CPU, execute the bit operation and write the result back to the register. Caution must be used when these instructions are applied to a port with both inputs and outputs defined. For example, a BSF operation on bit5 of GPIO will cause all eight bits of GPIO to be read into the CPU. Then the BSF operation takes place on bit5 and GPIO is written to the output latches. If another bit of GPIO is used as a bi-directional I/O pin (e.g., bit0) and it is defined as an input at this time, the input signal present on the pin itself would be read into the CPU and rewritten to the data latch of this particular pin, overwriting the previous content. As long as the pin stays in the input mode, no problem occurs. However, if bit0 is switched to an output, the content of the data latch may now be unknown.

Reading the port register, reads the values of the port pins. Writing to the port register writes the value to the port latch. When using read-modify-write instructions (ex. BCF, BSF, etc.) on a port, the value of the port pins is read, the desired operation is done to this value, and this value is then written to the port latch.

Example 5-1 shows the effect of two sequential readmodify-write instructions on an I/O port.

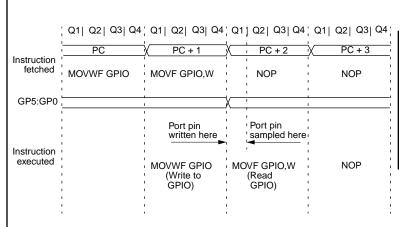

EXAMPLE 5-1: READ-MODIFY-WRITE INSTRUCTIONS ON AN I/O PORT

```
;Initial GPIO Settings
; GPIO<5:3> Inputs
; GPIO<2:0> Outputs
                    GPIO latch GPIO pins
  BCF
        GPIO, 5
                  ;--01 -ppp
                              --11 pppp
       GPIO, 4
 BCF
                  ;--10 -ppp
                               --11 pppp
 MOVLW 007h
 TRIS GPIO
                  ;--10 -ppp
                               --11 pppp
```

;Note that the user may have expected the pin ;values to be --00 pppp. The 2nd BCF caused ;GP5 to be latched as the pin value (High).

A pin actively outputting a Low or High should not be driven from external devices at the same time in order to change the level on this pin ("wired-or", "wired-and"). The resulting high output currents may damage the chip.

FIGURE 5-2: SUCCESSIVE I/O OPERATION

This example shows a write to GPIO followed by a read from GPIO.

Data setup time = (0.25 TCY - TPD)

where: Tcy = instruction cycle.

TPD = propagation delay

Therefore, at higher clock frequencies, a write followed by a read may be problematic.

6.0 TIMERO MODULE

The Timer0 module timer/counter has the following features:

- · 8-bit timer/counter
- · Readable and writable
- 8-bit software programmable prescaler
- · Internal or external clock select
- Interrupt on overflow from FFh to 00h
- · Edge select for external clock

Figure 6-1 is a simplified block diagram of the Timer0 module.

Timer mode is selected by clearing bit TOCS (OPTION<5>). In timer mode, the Timer0 module will increment every instruction cycle (without prescaler). If the TMR0 register is written, the increment is inhibited for the following two instruction cycles (Figure 6-2 and Figure 6-3). The user can work around this by writing an adjusted value to the TMR0 register.

Counter mode is selected by setting bit T0CS (OPTION<5>). In counter mode, Timer0 will increment either on every rising or falling edge of pin RA4/T0CKI. The incrementing edge is determined by the Timer0 Source Edge Select bit T0SE (OPTION<4>). Clearing

bit TOSE selects the rising edge. Restrictions on the external clock input are discussed in detail in Section 6.2.

The prescaler is mutually exclusively shared between the Timer0 module and the Watchdog Timer. The prescaler assignment is controlled in software by control bit PSA (OPTION<3>). Clearing bit PSA will assign the prescaler to the Timer0 module. The prescaler is not readable or writable. When the prescaler is assigned to the Timer0 module, prescale values of 1:2, 1:4, ..., 1:256 are selectable. Section 6.3 details the operation of the prescaler.

6.1 Timer0 Interrupt

The TMR0 interrupt is generated when the TMR0 register overflows from FFh to 00h. This overflow sets bit T0IF (INTCON<2>). The interrupt can be masked by clearing bit T0IE (INTCON<5>). Bit T0IF must be cleared in software by the Timer0 module interrupt service routine before re-enabling this interrupt. The TMR0 interrupt cannot awaken the processor from SLEEP since the timer is shut off during SLEEP. See Figure 6-4 for Timer0 interrupt timing.

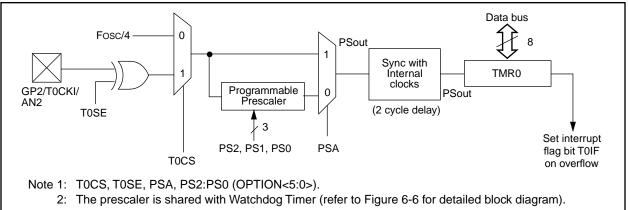

FIGURE 6-2: TIMER0 TIMING: INTERNAL CLOCK/NO PRESCALE

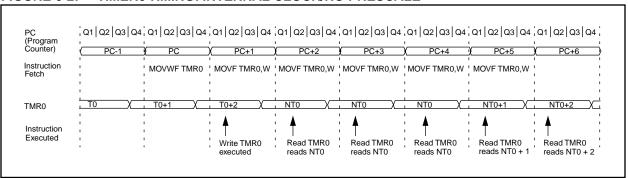

FIGURE 6-3: TIMERO TIMING: INTERNAL CLOCK/PRESCALE 1:2

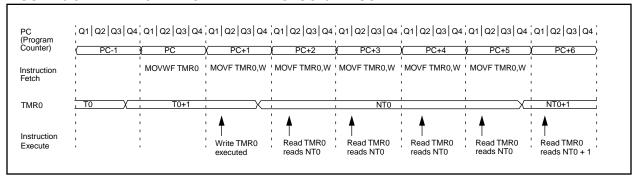

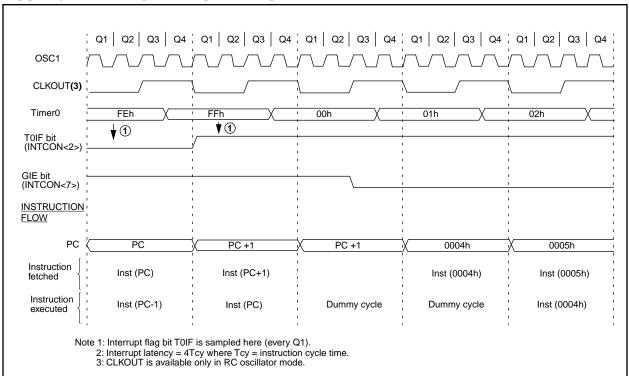

FIGURE 6-4: TIMERO INTERRUPT TIMING

6.2 <u>Using Timer0 with an External Clock</u>

When an external clock input is used for Timer0, it must meet certain requirements. The requirements ensure the external clock can be synchronized with the internal phase clock (Tosc). Also, there is a delay in the actual incrementing of Timer0 after synchronization.

6.2.1 EXTERNAL CLOCK SYNCHRONIZATION

When no prescaler is used, the external clock input is the same as the prescaler output. The synchronization of T0CKI with the internal phase clocks is accomplished by sampling the prescaler output on the Q2 and Q4 cycles of the internal phase clocks (Figure 6-5). Therefore, it is necessary for T0CKI to be high for at least 2Tosc (and a small RC delay of 20 ns) and low for at least 2Tosc (and a small RC delay of 20 ns). Refer to the electrical specification of the desired device.

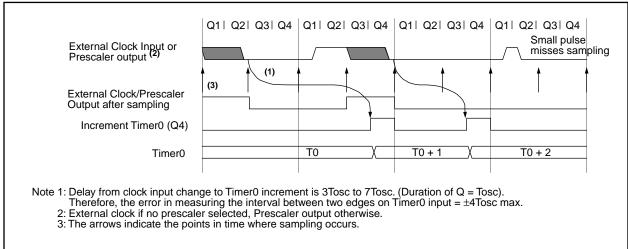

When a prescaler is used, the external clock input is divided by the asynchronous ripple-counter type pres-

caler so that the prescaler output is symmetrical. For the external clock to meet the sampling requirement, the ripple-counter must be taken into account. Therefore, it is necessary for T0CKI to have a period of at least 4Tosc (and a small RC delay of 40 ns) divided by the prescaler value. The only requirement on T0CKI high and low time is that they do not violate the minimum pulse width requirement of 10 ns. Refer to parameters 40, 41 and 42 in the electrical specification of the desired device.

6.2.2 TMR0 INCREMENT DELAY

Since the prescaler output is synchronized with the internal clocks, there is a small delay from the time the external clock edge occurs to the time the Timer0 module is actually incremented. Figure 6-5 shows the delay from the external clock edge to the timer incrementing.

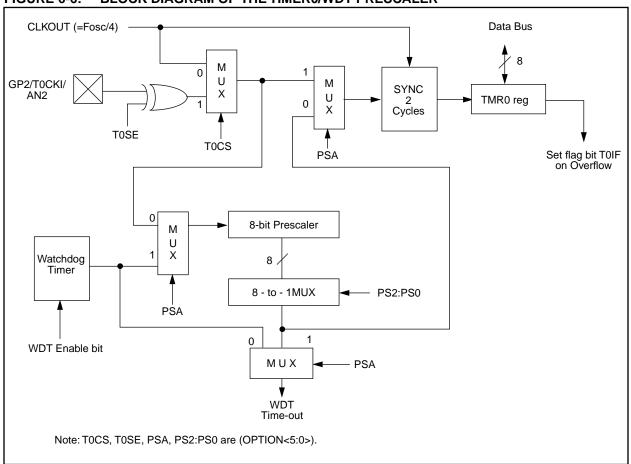

6.3 Prescaler

An 8-bit counter is available as a prescaler for the Timer0 module, or as a postscaler for the Watchdog Timer, respectively (Figure 6-6). For simplicity, this counter is being referred to as "prescaler" throughout this data sheet. Note that there is only one prescaler available which is mutually exclusively shared between the Timer0 module and the Watchdog Timer. Thus, a prescaler assignment for the Timer0 module means that there is no prescaler for the Watchdog Timer, and vice-versa.

The PSA and PS2:PS0 bits (OPTION<3:0>) determine the prescaler assignment and prescale ratio.

When assigned to the Timer0 module, all instructions writing to the TMR0 register (e.g. CLRF 1, MOVWF 1, BSF 1, x....etc.) will clear the prescaler. When assigned to WDT, a CLRWDT instruction will clear the prescaler along with the Watchdog Timer. The prescaler is not readable or writable.

FIGURE 6-6: BLOCK DIAGRAM OF THE TIMERO/WDT PRESCALER

6.3.1 SWITCHING PRESCALER ASSIGNMENT

The prescaler assignment is fully under software control, i.e., it can be changed "on the fly" during program execution.

Note: To avoid an unintended device RESET, the following instruction sequence (shown in Example 6-1) must be executed when changing the prescaler assignment from Timer0 to the WDT. This sequence must be followed even if the WDT is disabled.

EXAMPLE 6-1: CHANGING PRESCALER (TIMER0→WDT)

NOTES:

7.0 ANALOG-TO-DIGITAL CONVERTER (A/D) MODULE

The analog-to-digital (A/D) converter module has four analog inputs.

The A/D allows conversion of an analog input signal to a corresponding 8-bit digital number (refer to Application Note AN546 for use of A/D Converter). The output of the sample and hold is the input into the converter, which generates the result via successive approximation. The analog reference voltage is software selectable to either the device's positive supply voltage (VDD) or the voltage level on the GP1/AN1/VREF pin. The A/D converter has a unique feature of being able to operate while the device is in SLEEP mode.

The A/D module has three registers. These registers are:

- A/D Result Register (ADRES)
- A/D Control Register 0 (ADCON0)
- A/D Control Register 1 (ADCON1)

The ADCON0 register, shown in Figure 7-1, controls the operation of the A/D module. The ADCON1 register, shown in Figure 7-2, configures the functions of the port pins. The port pins can be configured as analog inputs (GP1 can also be a voltage reference) or as digital I/O.

Note: If the port pins are configured as analog inputs (reset condition), reading the port (MOVF GP,W) results in reading '0's.

100	D	D	А	Α	VDD
101	D	D	VREF	Α	GP1
110	D	D	D	Α	VDD
111	D	D	D	D	_

A = Analog input

D = Digital I/O

Note 1: Value on reset.

Note: Any instruction that reads a pin configured as an analog input will read a '0'.

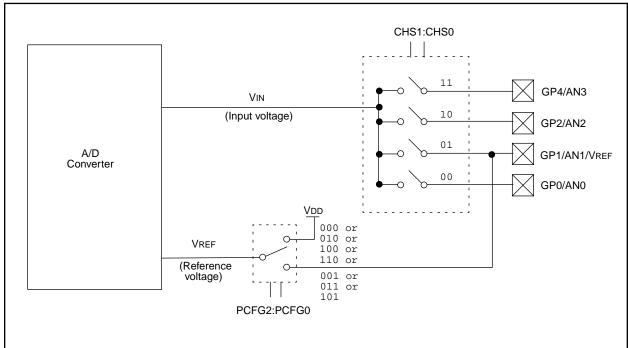

The ADRES register contains the result of the A/D conversion. When the A/D conversion is complete, the result is loaded into the ADRES register, the GO/DONE bit (ADCON0<2>) is cleared, and A/D interrupt flag bit ADIF (PIE1<6>) is set. The block diagrams of the A/D module are shown in Figure 7-3.

After the A/D module has been configured as desired, the selected channel must be acquired before the conversion is started. The analog input channels must have their corresponding TRIS bits selected as an input. To determine sample time, see Section 7.1. After this acquisition time has elapsed the A/D conversion can be started. The following steps should be followed for doing an A/D conversion:

- 1. Configure the A/D module:
 - Configure analog pins / voltage reference / and digital I/O (ADCON1)
 - Select A/D input channel (ADCON0)
 - Select A/D conversion clock (ADCON0)
 - Turn on A/D module (ADCON0)

- 2. Configure A/D interrupt (if desired):
 - · Clear ADIF bit
 - · Set ADIE bit
 - · Set GIE bit
- 3. Wait the required acquisition time.
- Start conversion:
 - Set GO/DONE bit (ADCON0)
- 5. Wait for A/D conversion to complete, by either:
 - Polling for the GO/DONE bit to be cleared OR
 - · Waiting for the A/D interrupt
- Read A/D Result register (ADRES), clear bit ADIF if required.
- For next conversion, go to step 1 or step 2 as required. The A/D conversion time per bit is defined as TAD. A minimum wait of 2TAD is required before next acquisition starts.

FIGURE 7-3: A/D BLOCK DIAGRAM

7.1 A/D Sampling Requirements

For the A/D converter to meet its specified accuracy, the charge holding capacitor (CHOLD) must be allowed to fully charge to the input channel voltage level. The analog input model is shown in Figure 7-4. The source impedance (Rs) and the internal sampling switch (Rss) impedance directly affect the time required to charge the capacitor CHOLD. The sampling switch (Rss) impedance varies over the device voltage (VDD), see Figure 7-4. The maximum recommended impedance for analog sources is 10 k Ω . After the analog input channel is selected (changed) this acquisition must be done before the conversion can be started.

To calculate the minimum acquisition time, Equation 7-1 may be used. This equation assumes that 1/2 LSb error is used (512 steps for the A/D). The 1/2 LSb error is the maximum error allowed for the A/D to meet its specified resolution.

EQUATION 7-1: A/D MINIMUM CHARGING TIME

VHOLD = (VREF - (VREF/512)) • (1 - $e^{(-Tc/CHOLD(Ric + Rss + Rs))}$)

 $Tc = -(51.2 pF)(1 k\Omega + Rss + Rs) ln(1/511)$

Example 7-1 shows the calculation of the minimum required acquisition time TACQ. This calculation is based on the following system assumptions.

 $Rs = 10 k\Omega$

1/2 LSb error

 $VDD = 5V \rightarrow Rss = 7 \text{ k}\Omega$

Temp (system max.) = 50°C

VHOLD = 0 @ t = 0

Note 1: The reference voltage (VREF) has no effect on the equation, since it cancels itself out.

Note 2: The charge holding capacitor (CHOLD) is not discharged after each conversion.

Note 3: The maximum recommended impedance for analog sources is 10 k Ω . This is required to meet the pin leakage specification.

Note 4: After a conversion has completed, a 2.0 TAD delay must complete before acquisition can begin again. During this time the holding capacitor is not connected to the selected A/D input channel.

EXAMPLE 7-1: CALCULATING THE MINIMUM REQUIRED SAMPLE TIME

TACQ = Amplifier Settling Time +

Holding Capacitor Charging Time +

Temperature Coefficient

TACQ = $5 \mu s + Tc + [(Temp - 25^{\circ}C)(0.05 \mu s/^{\circ}C)]$

Tc = -CHOLD (Ric + Rss + Rs) In(1/512)

-51.2 pF (1 kΩ + 7 kΩ + 10 kΩ) ln(0.0020)

-51.2 pF (18 kΩ) ln(0.0020)

-0.921 μs (-6.2146)

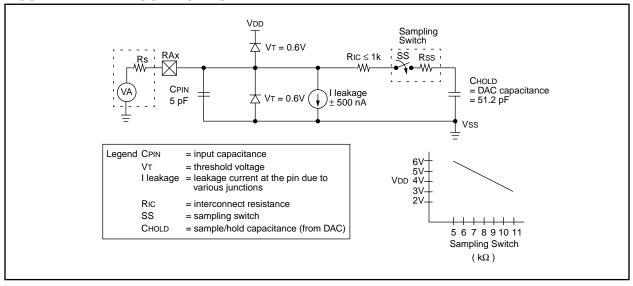

5.724 µs

TACQ = $5 \mu s + 5.724 \mu s + [(50^{\circ}C - 25^{\circ}C)(0.05 \mu s/^{\circ}C)]$

 $10.724 \, \mu s + 1.25 \, \mu s$

11.974 μs

FIGURE 7-4: ANALOG INPUT MODEL

7.2 <u>Selecting the A/D Conversion Clock</u>

The A/D conversion time per bit is defined as TAD. The A/D conversion requires 9.5 TAD per 8-bit conversion. The source of the A/D conversion clock is software selected. The four possible options for TAD are:

- 2Tosc
- 8Tosc
- 32Tosc
- · Precision internal 4 MHz oscillator

For correct A/D conversions, the A/D conversion clock (TAD) must be selected to ensure a minimum TAD time of 1.6 μ s.

Table 7-1 shows the resultant TAD times derived from the device operating frequencies and the A/D clock source selected.

7.3 Configuring Analog Port Pins

The ADCON1 and TRIS registers control the operation of the A/D port pins. The port pins that are desired as analog inputs must have their corresponding TRIS bits set (input). If the TRIS bit is cleared (output), the digital output level (VOH or VOL) will be converted.

The A/D operation is independent of the state of the CHS2:CHS0 bits and the TRIS bits.

Note 1: When reading the port register, all pins configured as analog input channel will read as cleared (a low level). Pins configured as digital inputs, will convert an analog input. Analog levels on a digitally configured input will not affect the conversion accuracy.

Note 2: Analog levels on any pin that is defined as a digital input (including the AN3:AN0 pins), may cause the input buffer to consume current that is out of the devices specification.

TABLE 7-1: TAD vs. DEVICE OPERATING FREQUENCIES

AD Clock Source		Device Frequency				
Operation	ADCS1:ADCS0	4 MHz	1.25 MHz	333.33 kHz		
2Tosc	00	500 ns ⁽²⁾	1.6 µs	6 μs		
8Tosc	01	2.0 μs	6.4 μs	24 μs ⁽³⁾		
32Tosc	10	8.0 µs	25.6 μs ⁽³⁾	96 μs ⁽³⁾		
Internal ADC RC Oscillator ⁽⁵⁾	11	2 - 6 μs ^(1,4)	2 - 6 μs ^(1,4)	2 - 6 μs ⁽¹⁾		

- Note 1: The RC source has a typical TAD time of 4 μs .
 - 2: These values violate the minimum required TAD time.
 - 3: For faster conversion times, the selection of another clock source is recommended.
 - 4: While in RC mode, with device frequency above 1 MHz, conversion accuracy is out of specification.
 - 5: For extended voltage devices (LC), please refer to Electrical Specifications section.

7.4 A/D Conversions

Example 7-2 show how to perform an A/D conversion. The GP pins are configured as analog inputs. The analog reference (VREF) is the device VDD. The A/D interrupt is enabled, and the A/D conversion clock is FRC. The conversion is performed on the GP0 channel.

Note: The GO/DONE bit should NOT be set in the same instruction that turns on the A/D.

Clearing the GO/DONE bit during a conversion will abort the current conversion. The ADRES register will NOT be updated with the partially completed A/D conversion sample. That is, the ADRES register will continue to contain the value of the last completed conversion (or the last value written to the ADRES register). After the A/D conversion is aborted, a 2TAD wait is required before the next acquisition is started. After this 2TAD wait, an acquisition is automatically started on the selected channel.

```

7.5 A/D Operation During Sleep

The A/D module can operate during SLEEP mode. This requires that the A/D clock source be set to RC (ADCS1:ADCS0 = 11). When the RC clock source is selected, the A/D module waits one instruction cycle before starting the conversion. This allows the SLEEP instruction to be executed, which eliminates all digital switching noise from the conversion. When the conversion is completed the GO/\overline{DONE} bit will be cleared, and the result loaded into the ADRES register. If the A/D interrupt is enabled, the device will wake-up from SLEEP. If the A/D interrupt is not enabled, the A/D module will then be turned off, although the ADON bit will remain set.

When the A/D clock source is another clock option (not RC), a SLEEP instruction will cause the present conversion to be aborted and the A/D module to be turned off, though the ADON bit will remain set.

Turning off the A/D places the A/D module in its lowest current consumption state.

Note: For the A/D module to operate in SLEEP, the A/D clock source must be set to RC (ADCS1:ADCS0 = 11). To perform an A/D conversion in SLEEP, the GO/DONE bit must be set, followed by the SLEEP instruction.

7.6 A/D Accuracy/Error

The overall accuracy of the A/D is less than \pm 1 LSb for VDD = $5V \pm 10\%$ and the analog VREF = VDD. This overall accuracy includes offset error, full scale error, and integral error. The A/D converter is guaranteed to be monotonic. The resolution and accuracy may be less when either the analog reference (VDD) is less than 5.0V or when the analog reference (VREF) is less than VDD.

The maximum pin leakage current is $\pm 5 \mu A$.

In systems where the device frequency is low, use of the A/D RC clock is preferred. At moderate to high frequencies, TAD should be derived from the device oscillator. TAD must not violate the minimum and should be $\leq 8~\mu s$ for preferred operation. This is because TAD, when derived from ToSC, is kept away from on-chip phase clock transitions. This reduces, to a large extent, the effects of digital switching noise. This is not possible with the RC derived clock. The loss of accuracy due to digital switching noise can be significant if many I/O pins are active.

In systems where the device will enter SLEEP mode after the start of the A/D conversion, the RC clock source selection is required. In this mode, the digital noise from the modules in SLEEP are stopped. This method gives high accuracy.

7.7 Effects of a RESET

A device reset forces all registers to their reset state. This forces the A/D module to be turned off, and any conversion is aborted. The value that is in the ADRES register is not modified for a Power-on Reset. The ADRES register will contain unknown data after a Power-on Reset.

7.8 Connection Considerations

If the input voltage exceeds the rail values (VSS or VDD) by greater than 0.2V, then the accuracy of the conversion is out of specification.

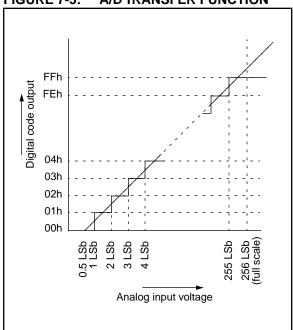

Note: For the PIC12C67X, care must be taken when using the GP4 pin in A/D conversions due to its proximity to the OSC1 pin.

An external RC filter is sometimes added for anti-aliasing of the input signal. The R component should be selected to ensure that the total source impedance is kept under the 10 k Ω recommended specification. Any external components connected (via hi-impedance) to an analog input pin (capacitor, zener diode, etc.) should have very little leakage current at the pin.

7.9 Transfer Function

The ideal transfer function of the A/D converter is as follows: the first transition occurs when the analog input voltage (VAIN) is 1 LSb (or Analog VREF / 256) (Figure 7-5).

FIGURE 7-5: A/D TRANSFER FUNCTION

8.0 SPECIAL FEATURES OF THE CPU

What sets a microcontroller apart from other processors are special circuits to deal with the needs of real-time applications. The PIC12C67X family has a host of such features intended to maximize system reliability, minimize cost through elimination of external components, provide power saving operating modes and offer code protection. These are:

- · Oscillator selection
- Reset
 - Power-on Reset (POR)
 - Power-up Timer (PWRT)
 - Oscillator Start-up Timer (OST)
- Interrupts
- Watchdog Timer (WDT)
- SLEEP
- · Code protection
- · ID locations
- · In-circuit serial programming

The PIC12C67X has a Watchdog Timer which can be shut off only through configuration bits. It runs off its own RC oscillator for added reliability. There are two timers that offer necessary delays on power-up. One is the Oscillator Start-up Timer (OST), intended to keep

the chip in reset until the crystal oscillator is stable. The other is the Power-up Timer (PWRT), which provides a fixed delay of 72 ms (nominal) on power-up only, designed to keep the part in reset while the power supply stabilizes. With these two timers on-chip, most applications need no external reset circuitry.

SLEEP mode is designed to offer a very low current power-down mode. The user can wake-up from SLEEP through external reset, Watchdog Timer Wake-up, or through an interrupt. Several oscillator options are also made available to allow the part to fit the application. The EXTRC oscillator option saves system cost while the LP crystal option saves power. A set of configuration bits are used to select various options.

8.1 Configuration Bits

The configuration bits can be programmed (read as '0') or left unprogrammed (read as '1') to select various device configurations. These bits are mapped in program memory location 2007h.

The user will note that address 2007h is beyond the user program memory space. In fact, it belongs to the special test/configuration memory space (2000h-3FFFh), which can be accessed only during programming.

8.2 Oscillator Configurations

8.2.1 OSCILLATOR TYPES

The PIC12C67X can be operated in seven different oscillator modes. The user can program three configuration bits (FOSC2:FOSC0) to select one of these seven modes:

• LP: Low Power Crystal

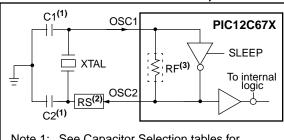

HS: High Speed Crystal Resonator

XT: Crystal/Resonator
 INTRC*: Internal 4 MHz Oscillator
 EXTRC*: External Resistor/Capacitor
 *Can be configured to support CLKOUT

8.2.2 CRYSTAL OSCILLATOR / CERAMIC RESONATORS

In XT, HS or LP modes, a crystal or ceramic resonator is connected to the GP5/OSC1/CLKIN and GP4/OSC2 pins to establish oscillation (Figure 8-2). The PIC12C67X oscillator design requires the use of a parallel cut crystal. Use of a series cut crystal may give a frequency out of the crystal manufacturers specifications. When in XT, HS or LP modes, the device can have an external clock source drive the GP5/OSC1/CLKIN pin (Figure 8-3).

FIGURE 8-2: CRYSTAL OPERATION
(OR CERAMIC RESONATOR)
(XT, HS OR LP OSC
CONFIGURATION)

- Note 1: See Capacitor Selection tables for recommended values of C1 and C2.
 - 2: A series resistor (RS) may be required for AT strip cut crystals.
 - 3: RF varies with the crystal chosen (approx. value = 10 M Ω).

FIGURE 8-3: EXTERNAL CLOCK INPUT OPERATION (XT, HS OR LP OSC CONFIGURATION)

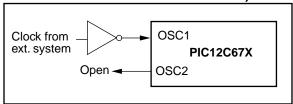

TABLE 8-1: CAPACITOR SELECTION FOR CERAMIC RESONATORS - PIC12C67X

Osc Type	Resonator Freq	Cap. Range C1	Cap. Range
XT	455 kHz	22-100 pF	(22-100 pF
	2.0 MHz	15-68 pF\	15-68 pF
	4.0 MHz	15-68 px	√15-68 pF
HS	4.0 MHz 1	15-68/pF	15-68 pF
	8.0 ₄ MHz\	\\\0-68 pF	10-68 pF
	10.0 WHz	10-22 pF	10-22 pF

These values are for design guidance only. Since each resonator has its own characteristics, the user should consult the resonator manufacturer for appropriate values of external components.

TABLE 8-2: CAPACITOR SELECTION FOR CRYSTAL OSCILLATOR - PIC12C67X

Osc Type	Resonator Freq	Cap.Range C1	Cap. Range C2
LP	32 kHz ⁽¹⁾	15 pF	15 pF
	100 kHz	15-30 pF	30-47 pF
	200 kHz	15-30 pF	15-82 pF
XT	100 kHz	15-30 pF	200\300.»F
	200 kHz	15-30/pE\\	100-200 pF
	455 kHz	15-30 pF	¹ 15-100 pF
	1 MHz 🔨	1/15-30/pF	15-30 pF
	2 MHz \\	\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\	15-30 pF
	4 MHz	15-47 pF	15-47 pF
HS	4 MHz	15-30 pF	15-30 pF
(O)\(√ 8 MHz	15-30 pF	15-30 pF
	10 MHz	15-30 pF	15-30 pF

Note 1: For VDD > 4.5V, C1 = C2 \approx 30 pF is recommended.

These values are for design guidance only. Rs may be required in HS mode as well as XT mode to avoid overdriving crystals with low drive level specification. Since each crystal has its own characteristics, the user should consult the crystal manufacturer for appropriate values of external components.

8.2.3 EXTERNAL CRYSTAL OSCILLATOR CIRCUIT

Either a prepackaged oscillator or a simple oscillator circuit with TTL gates can be used as an external crystal oscillator circuit. Prepackaged oscillators provide a wide operating range and better stability. A well-designed crystal oscillator will provide good performance with TTL gates. Two types of crystal oscillator circuits can be used: one with parallel resonance, or one with series resonance.

Figure 8-4 shows implementation of a parallel resonant oscillator circuit. The circuit is designed to use the fundamental frequency of the crystal. The 74AS04 inverter performs the 180-degree phase shift that a parallel oscillator requires. The 4.7 k Ω resistor provides the negative feedback for stability. The 10 k Ω potentiometers bias the 74AS04 in the linear region. This circuit could be used for external oscillator designs.

FIGURE 8-4: EXTERNAL PARALLEL RESONANT CRYSTAL OSCILLATOR CIRCUIT

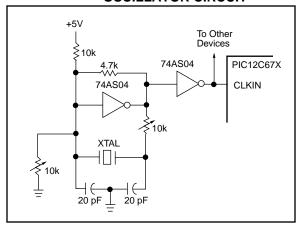

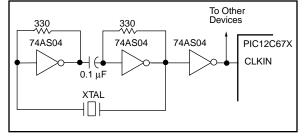

Figure 8-5 shows a series resonant oscillator circuit. This circuit is also designed to use the fundamental frequency of the crystal. The inverter performs a 180-degree phase shift in a series resonant oscillator circuit. The 330 Ω resistors provide the negative feedback to bias the inverters in their linear region.

FIGURE 8-5: EXTERNAL SERIES
RESONANT CRYSTAL
OSCILLATOR CIRCUIT

8.2.4 EXTERNAL RC OSCILLATOR

For timing insensitive applications, the RC device option offers additional cost savings. The RC oscillator frequency is a function of the supply voltage, the resistor (Rext) and capacitor (Cext) values, and the operating temperature. In addition to this, the oscillator frequency will vary from unit to unit due to normal process parameter variation. Furthermore, the difference in lead frame capacitance between package types will also affect the oscillation frequency, especially for low Cext values. The user also needs to take into account variation due to tolerance of external R and C components used.

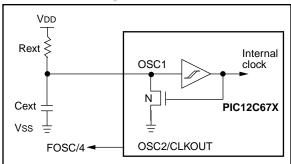

Figure 8-6 shows how the R/C combination is connected to the PIC12C67X. For Rext values below 2.2 k Ω , the oscillator operation may become unstable, or stop completely. For very high Rext values (e.g., 1 M Ω) the oscillator becomes sensitive to noise, humidity and leakage. Thus, we recommend keeping Rext between 3 k Ω and 100 k Ω .

Although the oscillator will operate with no external capacitor (Cext = 0 pF), we recommend using values above 20 pF for noise and stability reasons. With no or small external capacitance, the oscillation frequency can vary dramatically due to changes in external capacitances, such as PCB trace capacitance or package lead frame capacitance.

The Electrical Specifications sections show RC frequency variation from part to part due to normal process variation. The variation is larger for larger R (since leakage current variation will affect RC frequency more for large R) and for smaller C (since variation of input capacitance will affect RC frequency more).

Also, see the Electrical Specifications sections for variation of oscillator frequency due to VDD for given Rext/Cext values as well as frequency variation due to operating temperature for given R, C, and VDD values.

FIGURE 8-6: EXTERNAL RC OSCILLATOR MODE

8.2.5 INTERNAL 4 MHz RC OSCILLATOR

The internal RC oscillator provides a fixed 4 MHz (nominal) system clock at VDD = 5V and 25°C, see "Electrical Specifications" section for information on variation over voltage and temperature.

In addition, a calibration instruction is programmed into the last address of the program memory which contains the calibration value for the internal RC oscillator. This value is programmed as a RETLW XX instruction where XX is the calibration value. In order to retrieve the calibration value, issue a CALL YY instruction where YY is the last location in program memory (03FFh for the PIC12C671, 07FFh for the PIC12C672). Control will be returned to the user's program with the calibration value loaded into the W register. The program should then perform a MOVWF OSCCAL instruction to load the value into the internal RC oscillator trim register.

OSCCAL, when written to with the calibration value, will "trim" the internal oscillator to remove process variation from the oscillator frequency. Bits <7:4>, CAL3-CAL0 are used for fine calibration while bit 3, CALFST, and bit 2, CALSLW are used for more coarse adjustment. Adjusting CAL3-0 from 0000 to 1111 yields a higher clock speed. Set CALFST = 1 for greater increase in frequency or set CALSLW = 1 for greater decrease in frequency. Note that bits 1 and 0 of OSCCAL are unimplemented and should be written as 0 when modifying OSCCAL for compatibility with future devices.

Note: Please note that erasing the device will also erase the pre-programmed internal calibration value for the internal oscillator. The calibration value must be saved prior to erasing the part.

8.2.6 CLKOUT

The PIC12C67X can be configured to provide a clock out signal CLKOUT on pin 3 when the configuration word address (2007h) is programmed with FOSC2, FOSC1, FOSC0 equal to 101 for INTRC or 111 for EXTRC. The oscillator frequency, divided by 4 can be used for test purposes or to synchronize other logic.

8.3 Reset

The PIC12C67X differentiates between various kinds of reset:

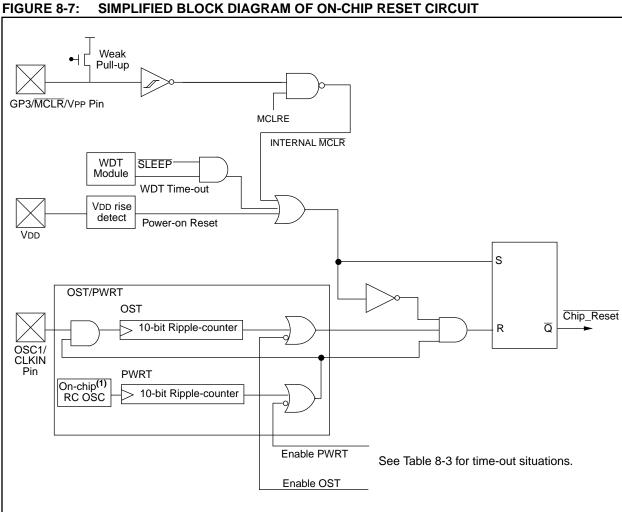

- Power-on Reset (POR)
- MCLR reset during normal operation
- MCLR reset during SLEEP
- WDT Reset (normal operation)

Some registers are not affected in any reset condition; their status is unknown on POR and unchanged in any other reset. Most other registers are reset to a "reset state" on Power-on Reset (POR), on the $\overline{\text{MCLR}}$ and WDT Reset, on $\overline{\text{MCLR}}$ reset during SLEEP. They are not affected by a WDT Wake-up, which is viewed as the resumption of normal operation. The $\overline{\text{TO}}$ and $\overline{\text{PD}}$ bits are set or cleared differently in different reset situations as indicated in Table 8-4. These bits are used in software to determine the nature of the reset. See Table 8-5 for a full description of reset states of all registers.

A simplified block diagram of the on-chip reset circuit is shown in Figure 8-7.

The PIC12C67X has a MCLR noise filter in the MCLR reset path. The filter will detect and ignore small pulses.

It should be noted that a WDT Reset does not drive $\overline{\text{MCLR}}$ pin low.

Note 1: This is a separate oscillator from the RC oscillator of the CLKIN pin.

Preliminary © 1997 Microchip Technology Inc. DS30561A-page 45

8.4 Power-on Reset (POR), Power-up Timer (PWRT) and Oscillator Start-up Timer (OST)

8.4.1 POWER-ON RESET (POR)

A Power-on Reset pulse is generated on-chip when VDD rise is detected (in the range of 1.5V - 2.1V). To take advantage of the POR, just tie the $\overline{\text{MCLR}}$ pin directly (or through a resistor) to VDD. This will eliminate external RC components usually needed to create a Power-on Reset. A maximum rise time for VDD is specified. See Electrical Specifications for details.

When the device starts normal operation (exits the reset condition), device operating parameters (voltage, frequency, temperature, ...) must be met to ensure operation. If these conditions are not met, the device must be held in reset until the operating conditions are met.

For additional information, refer to Application Note AN607, "Power-up Trouble Shooting."

8.4.2 POWER-UP TIMER (PWRT)

The Power-up Timer provides a fixed 72 ms nominal time-out on power-up only, from the POR. The Power-up Timer operates on an internal RC oscillator. The chip is kept in reset as long as the PWRT is active. The PWRT's time delay allows VDD to rise to an acceptable level. A configuration bit is provided to enable/disable the PWRT.

The power-up time delay will vary from chip to chip due to VDD, temperature, and process variation. See DC parameters for details.

8.4.3 OSCILLATOR START-UP TIMER (OST)

The Oscillator Start-up Timer (OST) provides 1024 oscillator cycle (from OSC1 input) delay after the PWRT delay is over. This ensures that the crystal oscillator or resonator has started and stabilized.

The OST time-out is invoked only for XT, LP and HS modes and only on Power-on Reset or wake-up from SLEEP.

8.4.4 TIME-OUT SEQUENCE

On power-up the time-out sequence is as follows: First PWRT time-out is invoked after the POR time delay has expired. Then OST is activated. The total time-out will vary based on oscillator configuration and the status of the PWRT. For example, in RC mode with the PWRT disabled, there will be no time-out at all. Figure 8-8, Figure 8-9, and Figure 8-10 depict time-out sequences on power-up.

Since the time-outs occur from the POR pulse, if MCLR is kept low long enough, the time-outs will expire. Then bringing MCLR high will begin execution immediately (Figure 8-9). This is useful for testing purposes or to synchronize more than one PIC12C67X device operating in parallel.

Table 8-5 shows the reset conditions for all the registers.

8.4.5 POWER CONTROL/STATUS REGISTER (PCON)

The power control/status register, PCON (address 8Eh) has one bit. See Figure 4-8 for register.

Bit1 is POR (Power-on Reset). It is cleared on a Power-on Reset and is unaffected otherwise. The user set this bit following a Power-on Reset. On subsequent resets if POR is '0', it will indicate that a Power-on Reset must have occurred.

TABLE 8-3: TIME-OUT IN VARIOUS SITUATIONS

Oscillator Configuration	Powe	Wake-up from SLEEP	
	PWRTE = 0	PWRTE = 1	
XT, HS, LP	72 ms + 1024Tosc	1024Tosc	1024Tosc
INTRC, EXTRC	72 ms	_	_

TABLE 8-4: STATUS BITS AND THEIR SIGNIFICANCE

POR	TO	PD	
0	1	1	Power-on Reset
0	0	х	Illegal, TO is set on POR
0	х	0	Illegal, PD is set on POR
1	0	1	WDT Reset
1	0	0	WDT Wake-up
1	u	u	MCLR Reset during normal operation
1	1	0	MCLR Reset during SLEEP or interrupt wake-up from SLEEP

TABLE 8-5: RESET CONDITION FOR SPECIAL REGISTERS

Condition	Program Counter	STATUS Register	PCON Register
Power-on Reset	000h	0001 1xxx	0-
MCLR Reset during normal operation	000h	0001 1uuu	u-
MCLR Reset during SLEEP	000h	0001 0uuu	u-
WDT Reset during normal operation	000h	0000 1uuu	u-

Legend: u = unchanged, x = unknown, -= unimplemented bit, read as '0', <math>q = value depends on condition Note 1: One or more bits in INTCON and PIR1 will be affected (to cause wake-up).

3: See Table 8-5 for reset value for specific condition.

^{2:} When the wake-up is due to an interrupt and the GIE bit is set, the PC is loaded with the interrupt vector (0004h).

FIGURE 8-8: TIME-OUT SEQUENCE ON POWER-UP (MCLR NOT TIED TO VDD): CASE 1

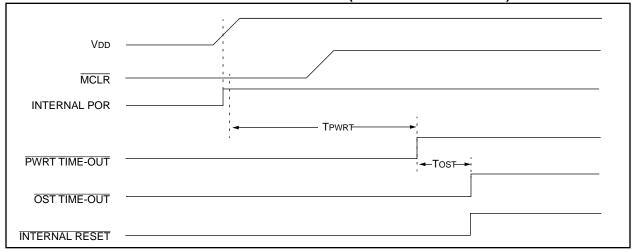

FIGURE 8-9: TIME-OUT SEQUENCE ON POWER-UP (MCLR NOT TIED TO VDD): CASE 2

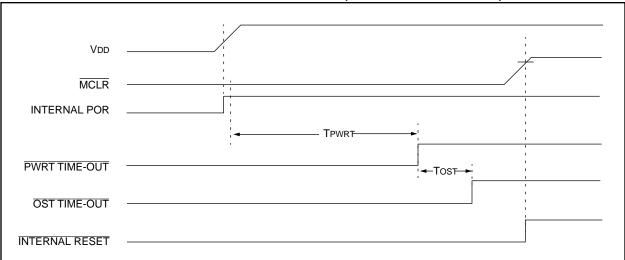

FIGURE 8-10: TIME-OUT SEQUENCE ON POWER-UP (MCLR TIED TO VDD)

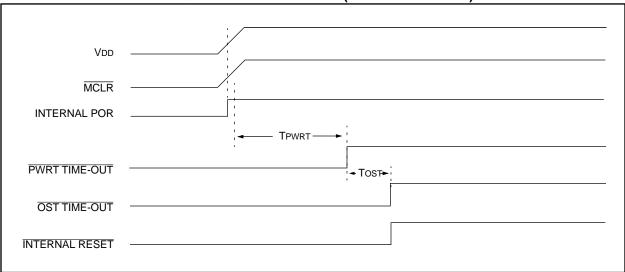

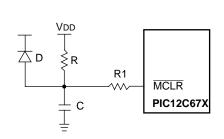

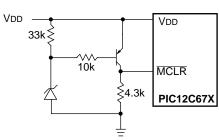

FIGURE 8-11: EXTERNAL POWER-ON RESET CIRCUIT (FOR SLOW VDD POWER-UP)

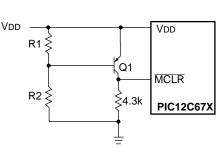

- Note 1: External Power-on Reset circuit is required only if VDD power-up slope is too slow. The diode D helps discharge the capacitor quickly when VDD powers down.
 - 2: $R < 40 \text{ k}\Omega$ is recommended to make sure that voltage drop across R does not violate the device's electrical specification.
 - 3: $R1 = 100\Omega$ to 1 k Ω will limit any current flowing into \overline{MCLR} from external capacitor C in the event of \overline{MCLR} /VPP pin breakdown due to Electrostatic Discharge (ESD) or Electrical Overstress (EOS).

FIGURE 8-12: EXTERNAL BROWN-OUT PROTECTION CIRCUIT 1

- Note 1: This circuit will activate reset when VDD goes below (Vz + 0.7V) where Vz = Zener voltage.
 - 2: Internal brown-out detection should be disabled when using this circuit.
 - 3: Resistors should be adjusted for the characteristics of the transistor.

FIGURE 8-13: EXTERNAL BROWN-OUT PROTECTION CIRCUIT 2

Note 1: This brown-out circuit is less expensive, albeit less accurate. Transistor Q1 turns off when VDD is below a certain level such that:

$$V_{DD} \bullet \frac{R1}{R1 + R2} = 0.7V$$

- 2: Internal brown-out detection should be disabled when using this circuit.
- 3: Resistors should be adjusted for the characteristics of the transistor.

8.5 Interrupts

There are four sources of interrupt:

Interrupt Sources
TMR0 overflow interrupt
External interrupt GP2/INT pin
GPIO Port change interrupts (pins GP0, GP1, GP3)
A/D Interrupt

The interrupt control register (INTCON) records individual interrupt requests in flag bits. It also has individual and global interrupt enable bits.

Note: Individual interrupt flag bits are set regardless of the status of their corresponding mask bit or the GIE bit.

A global interrupt enable bit, GIE (INTCON<7>) enables (if set) all un-masked interrupts or disables (if cleared) all interrupts. When bit GIE is enabled, and an interrupt's flag bit and mask bit are set, the interrupt will vector immediately. Individual interrupts can be disabled through their corresponding enable bits in various registers. Individual interrupt bits are set regardless of the status of the GIE bit. The GIE bit is cleared on reset.

The "return from interrupt" instruction, RETFIE, exits the interrupt routine as well as sets the GIE bit, which re-enables interrupts.

The GP2/INT, GPIO port change interrupt and the TMR0 overflow interrupt flags are contained in the INTCON register.

The peripheral interrupt flag ADIF, is contained in the special function register PIR1. The corresponding interrupt enable bit is contained in special function register PIE1, and the peripheral interrupt enable bit is contained in special function register INTCON.

When an interrupt is responded to, the GIE bit is cleared to disable any further interrupt, the return address is pushed onto the stack and the PC is loaded with 0004h. Once in the interrupt service routine the source(s) of the interrupt can be determined by polling the interrupt flag bits. The interrupt flag bit(s) must be cleared in software before re-enabling interrupts to avoid recursive interrupts.

For external interrupt events, such as GPIO change interrupt, the interrupt latency will be three or four instruction cycles. The exact latency depends when the interrupt event occurs (Figure 8-15). The latency is the same for one or two cycle instructions. Individual interrupt flag bits are set regardless of the status of their corresponding mask bit or the GIE bit.

FIGURE 8-14: INTERRUPT LOGIC

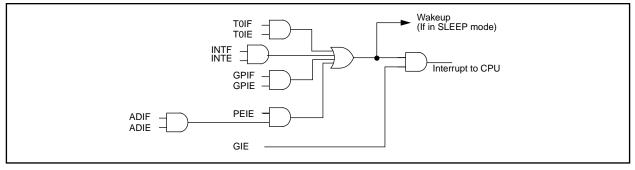

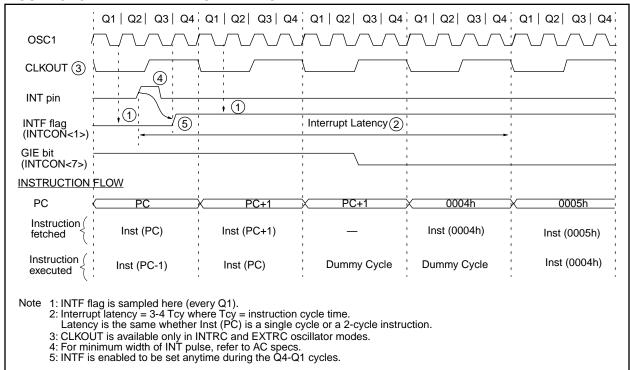

FIGURE 8-15: INT PIN INTERRUPT TIMING

8.5.1 TMR0 INTERRUPT

An overflow (FFh \rightarrow 00h) in the TMR0 register will set flag bit T0IF (INTCON<2>). The interrupt can be enabled/disabled by setting/clearing enable bit T0IE (INTCON<5>). (Section 6.0)

8.5.2 INT INTERRUPT

External interrupt on GP2/INT pin is edge triggered: either rising if bit INTEDG (OPTION<6>) is set, or falling, if the INTEDG bit is clear. When a valid edge appears on the GP2/INT pin, flag bit INTF (INTCON<1>) is set. This interrupt can be disabled by clearing enable bit INTE (INTCON<4>). Flag bit INTF must be cleared in software in the interrupt service routine before re-enabling this interrupt. The INT interrupt can wake-up the processor from SLEEP, if bit INTE was set prior to going into SLEEP. The status of global interrupt enable bit GIE decides whether or not the processor branches to the interrupt vector following wake-up. See Section 8.8 for details on SLEEP mode.

8.5.3 GPIO INTCON CHANGE

An input change on GP3, GP1 or GP0 sets flag bit GPIF (INTCON<0>). The interrupt can be enabled/disabled by setting/clearing enable bit GPIE (INTCON<3>). (Section 5.2)

8.6 Context Saving During Interrupts

During an interrupt, only the return PC value is saved on the stack. Typically, users may wish to save key registers during an interrupt i.e., W register and STATUS register. This will have to be implemented in software.

Example 8-1 store and restore the STATUS and W registers. The register, W_TEMP, must be defined in both banks and must be defined at the same offset from the bank base address (i.e., if W_TEMP is defined at 0x20 in bank 0, it must also be defined at 0xA0 in bank 1).

The example:

- a) Stores the W register.
- b) Stores the STATUS register in bank 0.
- c) Executes the ISR code.
- d) Restores the STATUS register (and bank select bit).
- e) Restores the W register.

EXAMPLE 8-1: SAVING STATUS AND W REGISTERS IN RAM

```
MOVWF
         W_TEMP
                           ;Copy W to TEMP register, could be bank one or zero
SWAPF
         STATUS, W
                           ;Swap status to be saved into W
BCF
         STATUS, RP0
                           ; Change to bank zero, regardless of current bank
MOVWF
         STATUS_TEMP
                           ; Save status to bank zero STATUS_TEMP register
:(ISR)
SWAPF
         STATUS_TEMP, W
                           ;Swap STATUS_TEMP register into W
                           ;(sets bank to original state)
MOVWE
         STATUS
                           ; Move W into STATUS register
         W_TEMP,F
                           ;Swap W_TEMP
SWAPF
SWAPF
         W_TEMP,W
                           ;Swap W_TEMP into W
```

8.7 Watchdog Timer (WDT)

The Watchdog Timer is as a free running on-chip RC oscillator which does not require any external components. This RC oscillator is separate from the RC oscillator of the OSC1/CLKIN pin. That means that the WDT will run, even if the clock on the OSC1/CLKIN and OSC2/CLKOUT pins of the device has been stopped, for example, by execution of a SLEEP instruction. During normal operation, a WDT time-out generates a device RESET (Watchdog Timer Reset). If the device is in SLEEP mode, a WDT time-out causes the device to wake-up and continue with normal operation (Watchdog Timer Wake-up). The WDT can be permanently disabled by clearing configuration bit WDTE (Section 8.1).

8.7.1 WDT PERIOD

The WDT has a nominal time-out period of 18 ms, (with no prescaler). The time-out periods vary with temperature, VDD and process variations from part to part (see DC specs). If longer time-out periods are desired, a prescaler with a division ratio of up to 1:128 can be assigned to the WDT under software control by writing to the OPTION register. Thus, time-out periods up to 2.3 seconds can be realized.

The CLRWDT and SLEEP instructions clear the WDT and the postscaler, if assigned to the WDT, and prevent it from timing out early and generating a premature device RESET condition.

The TO bit in the STATUS register will be cleared upon a Watchdog Timer time-out.

8.7.2 WDT PROGRAMMING CONSIDERATIONS

It should also be taken into account that under worst case conditions (VDD = Min., Temperature = Max., and max. WDT prescaler) it may take several seconds before a WDT time-out occurs.

> When the prescaler is assigned to the WDT, always execute a CLRWDT instruction before changing the prescale value, otherwise a WDT reset may occur.

FIGURE 8-16: WATCHDOG TIMER BLOCK DIAGRAM

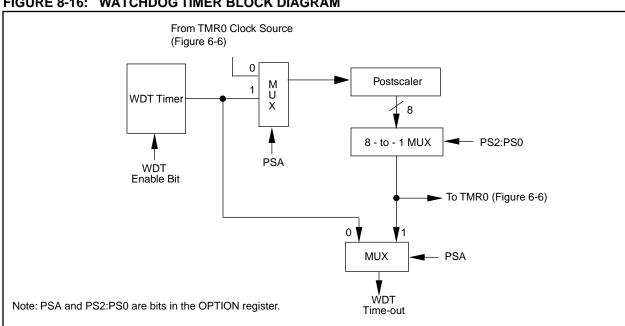

FIGURE 8-17: SUMMARY OF WATCHDOG TIMER REGISTERS

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
2007h	Config. bits ⁽¹⁾	MCLRE	CP1	CP0	PWRTE	WDTE	FOSC2	FOSC1	FOSC0
81h	OPTION	GPPU	INTEDG	T0CS	T0SE	PSA	PS2	PS1	PS0

Legend: Shaded cells are not used by the Watchdog Timer.

Note 1: See Figure 8-1 for operation of these bits. Not all CP0 and CP1 bits are shown.

Preliminary © 1997 Microchip Technology Inc. DS30561A-page 53

8.8 Power-down Mode (SLEEP)

Power-down mode is entered by executing a SLEEP instruction.

If enabled, the Watchdog Timer will be cleared but keeps running, the \overline{PD} bit (STATUS<3>) is cleared, the \overline{TO} (STATUS<4>) bit is set, and the oscillator driver is turned off. The I/O ports maintain the status they had, before the SLEEP instruction was executed (driving high, low, or hi-impedance).

For lowest current consumption in this mode, place all I/O pins at either VDD, or Vss, ensure no external circuitry is drawing current from the I/O pin, power-down the A/D, disable external clocks. Pull all I/O pins, that are hi-impedance inputs, high or low externally to avoid switching currents caused by floating inputs. The TOCKI input if enabled should also be at VDD or Vss for lowest current consumption. The contribution from onchip pull-ups on GPIO should be considered.

The MCLR pin if enabled must be at a logic high level (VIHMC).

8.8.1 WAKE-UP FROM SLEEP

The device can wake up from SLEEP through one of the following events:

- External reset input on MCLR pin.
- Watchdog Timer Wake-up (if WDT was enabled).
- 3. GP2/INT interrupt, interrupt GPIO port change, or some Peripheral Interrupts.

External \overline{MCLR} Reset will cause a device reset. All other events are considered a continuation of program execution and cause a "wake-up". The \overline{TO} and \overline{PD} bits in the STATUS register can be used to determine the cause of device reset. The \overline{PD} bit, which is set on power-up, is cleared when SLEEP is invoked. The \overline{TO} bit is cleared if a WDT time-out occurred (and caused wake-up).

The following peripheral interrupt can wake the device from SLEEP:

1. A/D conversion (when A/D clock source is RC).

Other peripherals can not generate interrupts since during SLEEP, no on-chip Q clocks are present.

When the SLEEP instruction is being executed, the next instruction (PC + 1) is pre-fetched. For the device to wake-up through an interrupt event, the corresponding interrupt enable bit must be set (enabled). Wake-up is regardless of the state of the GIE bit. If the GIE bit is clear (disabled), the device continues execution at the instruction after the SLEEP instruction. If the GIE bit is set (enabled), the device executes the instruction after the SLEEP instruction and then branches to the interrupt address (0004h). In cases where the execution of the instruction following SLEEP is not desirable, the user should have a NOP after the SLEEP instruction.

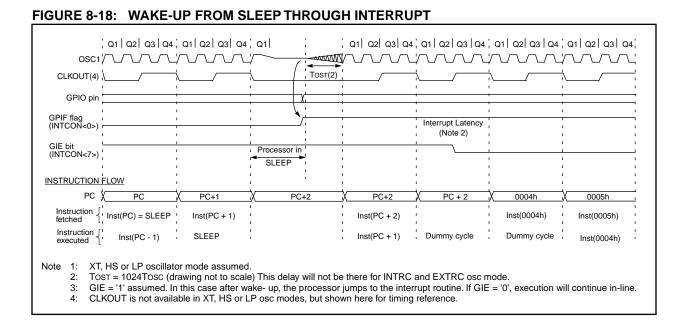

8.8.2 WAKE-UP USING INTERRUPTS

When global interrupts are disabled (GIE cleared) and any interrupt source has both its interrupt enable bit and interrupt flag bit set, one of the following will occur:

- If the interrupt occurs before the the execution of a SLEEP instruction, the SLEEP instruction will complete as a NOP. Therefore, the WDT and WDT postscaler will not be cleared, the TO bit will not be set and PD bits will not be cleared.
- If the interrupt occurs during or after the execution of a SLEEP instruction, the device will immediately wake up from sleep . The SLEEP instruction will be completely executed before the wake-up. Therefore, the WDT and WDT postscaler will be cleared, the TO bit will be set and the PD bit will be cleared.

Even if the flag bits were checked before executing a SLEEP instruction, it may be possible for flag bits to become set before the SLEEP instruction completes. To determine whether a SLEEP instruction executed, test the \overline{PD} bit. If the \overline{PD} bit is set, the SLEEP instruction was executed as a NOP.

To ensure that the WDT is cleared, a CLRWDT instruction should be executed before a SLEEP instruction.

8.9 Program Verification/Code Protection

If the code protection bit(s) have not been programmed, the on-chip program memory can be read out for verification purposes.

Note: Microchip does not recommend code protecting windowed devices.

8.10 ID Locations

Four memory locations (2000h - 2003h) are designated as ID locations where the user can store checksum or other code-identification numbers. These locations are not accessible during normal execution but are readable and writable during program/verify. It is recommended that only the 4 least significant bits of the ID location are used.

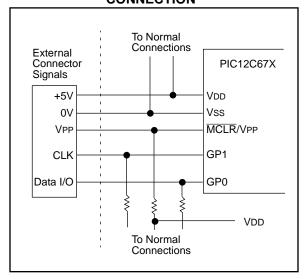

8.11 In-Circuit Serial Programming

PIC12C67X microcontrollers can be serially programmed while in the end application circuit. This is simply done with two lines for clock and data, and three other lines for power, ground, and the programming voltage. This allows customers to manufacture boards with unprogrammed devices, and then program the microcontroller just before shipping the product. This also allows the most recent firmware or a custom firmware to be programmed.

The device is placed into a program/verify mode by holding the GP1 and GP0 pins low while raising the $\overline{\text{MCLR}}$ (VPP) pin from VIL to VIHH (see programming specification). GP1 (clock) becomes the programming clock and GP0 (data) becomes the programming data. Both GP0 and GP1 are Schmitt Trigger inputs in this mode.

After reset, to place the device into programming/verify mode, the program counter (PC) is at location 00h. A 6-bit command is then supplied to the device. Depending on the command, 14-bits of program data are then supplied to or from the device, depending if the command was a load or a read. For complete details of serial programming, please refer to the PIC12C67X Programming Specifications.

FIGURE 8-19: TYPICAL IN-CIRCUIT SERIAL PROGRAMMING CONNECTION

PIC12C67X

NOTES:

9.0 INSTRUCTION SET SUMMARY

Each PIC12C67X instruction is a 14-bit word divided into an OPCODE which specifies the instruction type and one or more operands which further specify the operation of the instruction. The PIC12C67X instruction set summary in Table 9-2 lists **byte-oriented**, **bit-oriented**, and **literal and control** operations. Table 9-1 shows the opcode field descriptions.

For **byte-oriented** instructions, 'f' represents a file register designator and 'd' represents a destination designator. The file register designator specifies which file register is to be used by the instruction.

The destination designator specifies where the result of the operation is to be placed. If 'd' is zero, the result is placed in the W register. If 'd' is one, the result is placed in the file register specified in the instruction.

For **bit-oriented** instructions, 'b' represents a bit field designator which selects the number of the bit affected by the operation, while 'f' represents the number of the file in which the bit is located.

For **literal and control** operations, 'k' represents an eight or eleven bit constant or literal value.

TABLE 9-1: OPCODE FIELD DESCRIPTIONS

Field	Description
f	Register file address (0x00 to 0x7F)
M	Working register (accumulator)
b	Bit address within an 8-bit file register
k	Literal field, constant data or label
х	Don't care location (= 0 or 1) The assembler will generate code with $x = 0$. It is the recommended form of use for compatibility with all Microchip software tools.
d	Destination select; d = 0: store result in W, d = 1: store result in file register f. Default is d = 1
label	Label name
TOS	Top of Stack
PC	Program Counter
PCLATH	Program Counter High Latch
GIE	Global Interrupt Enable bit
WDT	Watchdog Timer/Counter
TO	Time-out bit
PD	Power-down bit
dest	Destination either the W register or the specified register file location
[]	Options
()	Contents
\rightarrow	Assigned to
<>	Register bit field
€	In the set of
italics	User defined term (font is courier)

The instruction set is highly orthogonal and is grouped into three basic categories:

- · Byte-oriented operations
- · Bit-oriented operations
- · Literal and control operations

All instructions are executed within one single instruction cycle, unless a conditional test is true or the program counter is changed as a result of an instruction. In this case, the execution takes two instruction cycles with the second cycle executed as a NOP. One instruction cycle consists of four oscillator periods. Thus, for an oscillator frequency of 4 MHz, the normal instruction execution time is 1 μs . If a conditional test is true or the program counter is changed as a result of an instruction, the instruction execution time is 2 μs .

Table 9-2 lists the instructions recognized by the MPASM assembler.

Figure 9-1 shows the three general formats that the instructions can have.

Note: To maintain upward compatibility with future PIC12C67X products, <u>do not use</u> the OPTION and TRIS instructions.

All examples use the following format to represent a hexadecimal number:

0xhh

where h signifies a hexadecimal digit.

FIGURE 9-1: GENERAL FORMAT FOR INSTRUCTIONS

9.1 <u>Special Function Registers as</u> Source/Destination

The PIC12C67X's orthogonal instruction set allows read and write of all file registers, including special function registers. There are some special situations the user should be aware of:

9.1.1 STATUS AS DESTINATION

If an instruction writes to STATUS, the Z, C and DC bits may be set or cleared as a result of the instruction and overwrite the original data bits written. For example, executing CLRF STATUS will clear register STATUS, and then set the Z bit leaving 0000 0100b in the register.

9.1.2 TRIS AS DESTINATION

Bit 3 of the TRIS register always reads as a '1' since GP3 is an input only pin. This fact can affect some read-modify-write operations on the TRIS register.

9.1.3 PCL AS SOURCE OR DESTINATION

Read, write or read-modify-write on PCL may have the following results:

Read PC: $PCL \rightarrow dest$

Write PCL: PCLATH \rightarrow PCH;

8-bit destination value → PCL

Read-Modify-Write: PCL→ ALU operand

PCLATH \rightarrow PCH; 8-bit result \rightarrow PCL

Where PCH = program counter high byte (not an addressable register), PCLATH = Program counter high holding latch, dest = destination, WREG or f.

9.1.4 BIT MANIPULATION

All bit manipulation instructions are done by first reading the entire register, operating on the selected bit and writing the result back (read-modify-write). The user should keep this in mind when operating on special function registers, such as ports.

TABLE 9-2: INSTRUCTION SET SUMMARY

Mnemonic,		Description	Cycles		14-Bit	Opcode)	Status	Notes
Operands				MSb			LSb	Affected

MOVLW	k	Move literal to W	1	11	00xx	kkkk	kkkk		
RETFIE	-	Return from interrupt	2	00	0000	0000	1001		
RETLW	k	Return with literal in W	2	11	01xx	kkkk	kkkk		
RETURN	-	Return from Subroutine	2	00	0000	0000	1000		
SLEEP	-	Go into standby mode	1	00	0000	0110	0011	TO,PD	
SUBLW	k	Subtract W from literal	1	11	110x	kkkk	kkkk	C,DC,Z	
XORLW	k	Exclusive OR literal with W	1	11	1010	kkkk		Z	
NI-1- 4 101		I/O and all the site of the si	l						

Note 1: When an I/O register is modified as a function of itself (e.g., MOVF PORTB, 1), the value used will be that value present on the pins themselves. For example, if the data latch is '1' for a pin configured as input and is driven low by an external device, the data will be written back with a '0'.

^{2:} If this instruction is executed on the TMR0 register (and, where applicable, d = 1), the prescaler will be cleared if assigned to the Timer0 Module.

^{3:} If Program Counter (PC) is modified or a conditional test is true, the instruction requires two cycles. The second cycle is executed as a NOP.

9.2 <u>Instruction Descriptions</u>

ADDLW	Add Literal and W
Syntax:	[label] ADDLW k
Operands:	$0 \leq k \leq 255$
Operation:	$(W) + k \to (W)$
Status Affected:	C, DC, Z
Encoding:	11 111x kkkk kkkk
Description:	The contents of the W register are added to the eight bit literal 'k' and the result is placed in the W register.
Words:	1
Cycles:	1
Example	ADDLW 0x15
	Before Instruction $W = 0x10$ After Instruction $W = 0x25$

ANDLW	And Literal with W	
Syntax:	[label] ANDLW k	
Operands:	$0 \le k \le 255$	
Operation:	(W) .AND. (k) \rightarrow (W)	
Status Affected:	Z	
Encoding:	11 1001 kkkk kkk	k
Description:	The contents of W register are AND'ed with the eight bit literal 'k'. T result is placed in the W register.	he
Words:	1	
Cycles:	1	
Example	ANDLW 0x5F	
	Before Instruction W = 0xA3 After Instruction W = 0x03	

ADDWF	Add W and f	
Syntax:	[label] ADDWF f,d	
Operands:	$0 \le f \le 127$ $d \in [0,1]$	
Operation:	$(W) + (f) \to (dest)$	
Status Affected:	C, DC, Z	
Encoding:	00 0111 dfff ffff	
Description:	Add the contents of the W register with register 'f'. If 'd' is 0 the result is stored in the W register. If 'd' is 1 the result is stored back in register 'f'.	
Words:	1	
Cycles:	1	
Example	ADDWF FSR, 0	
	Before Instruction W = 0x17 FSR = 0xC2 After Instruction	

W =

FSR =

0xD9

0xC2

ANDWF	AND W with f
Syntax:	[label] ANDWF f,d
Operands:	$0 \le f \le 127$ $d \in [0,1]$
Operation:	(W) .AND. (f) \rightarrow (dest)
Status Affected:	Z
Encoding:	00 0101 dfff ffff
Description:	AND the W register with register 'f'. If 'd' is 0 the result is stored in the W register. If 'd' is 1 the result is stored back in register 'f'.
Words:	1
Cycles:	1
Example	ANDWF FSR, 1
	Before Instruction $W = 0x17$ $FSR = 0xC2$ After Instruction $W = 0x17$ $FSR = 0x02$

BCF	Bit Clear	f		
Syntax:	[label] B	CF f,b)	
Operands:	$0 \le f \le 127$ $0 \le b \le 7$			
Operation:	$0 \rightarrow (f < b)$	>)		
Status Affected:	None			
Encoding:	01	00bb	bfff	ffff
Description:	Bit 'b' in re	gister 'f' is	s cleared.	
Words:	1			
Cycles:	1			
Example	BCF	FLAG_	REG, 7	
	Before Instruction FLAG_REG = 0xC7 After Instruction FLAG_REG = 0x47			

BTFSC	Bit Test, Skip if Clear
Syntax:	[label] BTFSC f,b
Operands:	$0 \le f \le 127$ $0 \le b \le 7$
Operation:	skip if $(f < b >) = 0$
Status Affected:	None
Encoding:	01 10bb bfff ffff
Description:	If bit 'b' in register 'f' is '0' then the next instruction is skipped. If bit 'b' is '0' then the next instruction fetched during the current instruction execution is discarded, and a NOP is executed instead, making this a 2 cycle instruction.
Words:	1
Cycles:	1(2)
Example	HERE BTFSC FLAG,1 FALSE GOTO PROCESS_CODE TRUE • • •
	Before Instruction PC = address HERE
	After Instruction
	<pre>if FLAG<1> = 0, PC = address TRUE if FLAG<1>=1,</pre>
	PC = address FALSE

BSF	Bit Set f			
Syntax:	[label] E	BSF f,b		
Operands:	$0 \le f \le 12$ $0 \le b \le 7$	27		
Operation:	$1 \rightarrow (f < b)$	>)		
Status Affected:	None			
Encoding:	01	01bb	bfff	ffff
Description:	Bit 'b' in re	gister 'f' is	s set.	
Words:	1			
Cycles:	1			
Example	BSF	FLAG_F	REG, 7	
	Before In	FLAG_R	EG = 0x0A	A
		FLAG_RE	EG = 0x8A	Ą

BTFSS	Bit Test f	, Skip if S	Set	
Syntax:	[label] B	TFSS f,k)	
Operands:	$0 \le f \le 12$ $0 \le b < 7$	7		
Operation:	skip if (f<	b>) = 1		
Status Affected:	None			
Encoding:	01	11bb	bfff	ffff
Description:	instruction If bit 'b' is ' fetched du execution,	register 'f' is is skipped. 1', then the ring the cu is discarde nstead, ma	next instru rrent instru d and a N	uction oction OP is
Words:	1			
Cycles:	1(2)			
Example	HERE FALSE TRUE		FLAG,1 PROCESS_	_CODE
	Before In	struction		
	After Inst	ruction		ERE
	i	if FLAG<1>	address F. = 1,	
		PC =	address T	RUE

CLRF	Clear f
Syntax:	[label] CLRF f
Operands:	$0 \le f \le 127$
Operation:	$\begin{array}{l} 00h \rightarrow (f) \\ 1 \rightarrow Z \end{array}$
Status Affected:	Z
Encoding:	00 0001 1fff ffff
Description:	The contents of register 'f' are cleared and the Z bit is set.
Words:	1
Cycles:	1
Example	CLRF FLAG_REG
	Before Instruction FLAG_REG = 0x5A After Instruction
	$FLAG_REG = 0x00$
	Z = 1

CALL	Call Subroutine			
Syntax:	[label] CALL k			
Operands:	$0 \le k \le 2047$			
Operation:	$ \begin{array}{l} (PC)+\ 1\rightarrow TOS, \\ k\rightarrow PC<10:0>, \\ (PCLATH<4:3>)\rightarrow PC<12:11> \end{array} $			
Status Affected:	None			
Encoding:	10 0kkk kkkk kkkk			
Description:	Call Subroutine. First, return address (PC+1) is pushed onto the stack. The eleven bit immediate address is loaded into PC bits <10:0>. The upper bits of the PC are loaded from PCLATH. CALL is a two cycle instruction.			
Words:	1			
Cycles:	2			
Example	HERE CALL THERE			
	Before Instruction PC = Address HERE After Instruction PC = Address THERE TOS = Address HERE+1			

CLRW	Clear W			
Syntax:	[label]	CLRW		
Operands:	None			
Operation:	$\begin{array}{c} 00h \rightarrow (V \\ 1 \rightarrow Z \end{array}$	V)		
Status Affected:	Z			
Encoding:	00	0001	0xxx	xxxx
Description:	W register set.	is cleare	d. Zero bit	(Z) is
Words:	1			
Cycles:	1			
G y 0.00.				
Example	CLRW			
-	CLRW Before In:	struction	ı	
-	Before In	W =	0x5A	
-	Before In	W =		

CLRWDT	Clear Watchdog Timer			
Syntax:	[label]	CLRWD	Т	
Operands:	None			
Operation:	00h → WDT 0 → WDT prescaler, 1 → $\overline{\text{TO}}$ 1 → $\overline{\text{PD}}$			
Status Affected:	TO, PD			
Encoding:	00	0000	0110	0100
Description:	CLRWDT instruction resets the Watchdog Timer. It also resets the prescaler of the WDT. Status bits TO and PD are set.			
Words:	1			
Cycles:	1			
Example	CLRWDT			
	After Inst	WDT cou	nter =	? 0x00 0 1

DECF	Decrement f
Syntax:	[label] DECF f,d
Operands:	$0 \le f \le 127$ $d \in [0,1]$
Operation:	(f) - 1 \rightarrow (dest)
Status Affected:	Z
Encoding:	00 0011 dfff ffff
Description:	Decrement register 'f'. If 'd' is 0 the result is stored in the W register. If 'd' is 1 the result is stored back in register 'f'.
Words:	1
Cycles:	1
Example	DECF CNT, 1
	Before Instruction $\begin{array}{rcl} CNT & = & 0x01 \\ Z & = & 0 \end{array}$ After Instruction $\begin{array}{rcl} CNT & = & 0x00 \\ Z & = & 1 \end{array}$

COMF	Complement f				
Syntax:	[label]	COMF	f,d		
Operands:	$0 \le f \le 127$ $d \in [0,1]$				
Operation:	$(\bar{f}) \rightarrow (des$	st)			
Status Affected:	Z				
Encoding:	00	1001	dff	f	ffff
Description:	The contermented. If 'W. If 'd' is 1 register 'f'.	'd' is 0 the	e resul	t is s	toreḋ in
Words:	1				
Cycles:	1				
Example	COMF	REG	31,0		
	After Insti	REG1	=	0x13 0x13 0xEC	

DECFSZ	Decrement f, Skip if 0		
Syntax:	[label] DECFSZ f,d		
Operands:	$0 \le f \le 127$ $d \in [0,1]$		
Operation:	(f) - 1 \rightarrow (dest); skip if result = 0		
Status Affected:	None		
Encoding:	00 1011 dfff ffff		
Description:	The contents of register 'f' are decremented. If 'd' is 0 the result is placed in the W register. If 'd' is 1 the result is placed back in register 'f'. If the result is 0, the next instruction, which is already fetched, is discarded. A NOP is executed instead making it a two cycle instruction.		
Words:	1		
Cycles:	1(2)		
Example	HERE DECFSZ CNT, 1 GOTO LOOP CONTINUE • •		
	Before Instruction PC = address HERE After Instruction CNT = CNT - 1 if CNT = 0, PC = address CONTINUE if CNT ≠ 0,		

PC = address HERE+1

GOTO	Unconditional Branch			
Syntax:	[label]	GOTO	k	
Operands:	$0 \le k \le 20$	047		
Operation:	$k \rightarrow PC < PCLATH$		PC<12:1	1>
Status Affected:	None			
Encoding:	10	1kkk	kkkk	kkkk
Description:	GOTO is ar eleven bit into PC bit PC are loagotto is a	immediato s <10:0>. ded from	e value is l The uppe PCLATH<	oaded r bits of 4:3>.
Words:	1			
Cycles:	2			
Example	GOTO TI	HERE		
	After Inst	ruction PC =	Address	THERE

INCFSZ	Increment f, Skip if 0		
Syntax:	[label] INCFSZ f,d		
Operands:	$0 \le f \le 127$ $d \in [0,1]$		
Operation:	(f) + 1 \rightarrow (dest), skip if result = 0		
Status Affected:	None		
Encoding:	00 1111 dfff ffff		
Description:	The contents of register 'f' are incremented. If 'd' is 0 the result is placed in the W register. If 'd' is 1 the result is placed back in register 'f'. If the result is 0, the next instruction, which is already fetched, is discarded. A NOP is executed instead making it a two cycle instruction.		
Words:	1		
Cycles:	1(2)		
Example	HERE INCFSZ CNT, 1 GOTO LOOP CONTINUE • • •		
	Before Instruction PC = address HERE After Instruction CNT = CNT + 1 if CNT= 0, PC = address CONTINUE if CNT≠ 0, PC = address HERE +1		

INCF	Increment f		
Syntax:	[label] INCF f,d		
Operands:	$0 \le f \le 127$ $d \in [0,1]$		
Operation:	(f) + 1 \rightarrow (dest)		
Status Affected:	Z		
Encoding:	00 1010 dfff	ffff	
Description:	The contents of register 'f' are is mented. If 'd' is 0 the result is p in the W register. If 'd' is 1 the replaced back in register 'f'.	laced	
Words:	1		
Cycles:	1		
Example	INCF CNT, 1		
	Before Instruction $\begin{array}{rcl} CNT & = & 0xFF \\ Z & = & 0 \end{array}$ After Instruction $\begin{array}{rcl} CNT & = & 0x00 \\ 7 & = & 1 \end{array}$		

IORLW	Inclusive OR Literal with W
Syntax:	[label] IORLW k
Operands:	$0 \le k \le 255$
Operation:	(W) .OR. $k \rightarrow$ (W)
Status Affected:	Z
Encoding:	11 1000 kkkk kkkk
Description:	The contents of the W register is OR'ed with the eight bit literal 'k'. The result is placed in the W register.
Words:	1
Cycles:	1
Example	IORLW 0x35
	Before Instruction W = 0x9A After Instruction W = 0xBF Z = 1

IORWF	Inclusive OR W with f		
Syntax:	[label] IORWF f,d		
Operands:	$0 \le f \le 127$ $d \in [0,1]$		
Operation:	(W) .OR. (f) \rightarrow (dest)		
Status Affected:	Z		
Encoding:	00 0100 dfff ffff		
Description:	Inclusive OR the W register with register 'f'. If 'd' is 0 the result is placed in the W register. If 'd' is 1 the result is placed back in register 'f'.		
Words:	1		
Cycles:	1		
Example	IORWF RESULT, 0		
	Before Instruction RESULT = 0x13 W = 0x91 After Instruction RESULT = 0x13 W = 0x93 Z = 1		

MOVF	Move f		
Syntax:	[label] MOVF f,d		
Operands:	$0 \le f \le 127$ $d \in [0,1]$		
Operation:	$(f) \to (dest)$		
Status Affected:	Z		
Encoding:	00 1000 dfff ffff		
Description:	The contents of register f is moved to a destination dependant upon the status of d. If $d = 0$, destination is W register. If $d = 1$, the destination is file register f itself. $d = 1$ is useful to test a file register since status flag Z is affected.		
Words:	1		
Cycles:	1		
Example	MOVF FSR, 0		
	After Instruction W = value in FSR register Z = 1		

MOVLW	Move Literal to W			
Syntax:	[label]	MOVLW	/ k	
Operands:	$0 \le k \le 2$	$0 \le k \le 255$		
Operation:	$k\to(W)$	$k \rightarrow (W)$		
Status Affected:	None			
Encoding:	11	00xx	kkkk	kkkk
Description:	J		k' is loaded ares will as	
Words:	1			
Cycles:	1			
Example	MOVLW	0x5A		
	After Inst	ruction W =	0x5A	

MOVWF	Move W to f
Syntax:	[label] MOVWF f
Operands:	$0 \le f \le 127$
Operation:	$(W) \rightarrow (f)$
Status Affected:	None
Encoding:	00 0000 lfff ffff
Description:	Move data from W register to register 'f'.
Words:	1
Cycles:	1
Example	MOVWF OPTION
	Defore Instruction

NOP	No Oper	ation		
Syntax:	[label]	NOP		
Operands:	None			
Operation:	No opera	ation		
Status Affected:	None			
Encoding:	00	0000	0xx0	0000
Description:	No operat	ion.		
Words:	1			
Cycles:	1			
Example	NOP			

RETFIE	Return from Interrupt			
Syntax:	[label]	RETFIE		
Operands:	None			
Operation:	$TOS \to F$ $1 \to GIE$	PC,		
Status Affected:	None			
Encoding:	0.0	0000	0000	1001
Description:	Return from and Top of the PC. Int ting Globa (INTCON< instruction	Stack (To errupts a I Interrupt (7>). This	OS) is load re enabled : Enable bi	ded in by set- t, GIE
Words:	1			
Cycles:	2			
Example	RETFIE			
		rrupt PC = GIE =	TOS 1	

OPTION	Load Op	tion Reç	gister	
Syntax:	[label] OPTION			
Operands:	None			
Operation:	$(W) \rightarrow O$	PTION		
Status Affected:	None			
Encoding:	0.0	0000	0110	0010
Description: Words: Cycles:	The contents of the W register are loaded in the OPTION register. This instruction is supported for code compatibility with PIC16C5X products. Since OPTION is a readable/writable register, the user can directly address it.			
Example	•			
	with futu	re PIC12	rd compa C67X prod struction.	ducts,

RETLW	Return with Literal in W
Syntax:	[label] RETLW k
Operands:	$0 \le k \le 255$
Operation:	$k \rightarrow (W);$ TOS \rightarrow PC
Status Affected:	None
Encoding:	11 01xx kkkk kkkk
Description:	The W register is loaded with the eight bit literal 'k'. The program counter is loaded from the top of the stack (the return address). This is a two cycle instruction.
Words:	1
Cycles:	2
Example	CALL TABLE ;W contains table ;offset value . ;W now has table value .
TABLE	ADDWF PC ;W = offset RETLW kl ;Begin table RETLW k2 ; RETLW kn ; End of table
	Before Instruction
	W = 0x07
	After Instruction
	W = value of k8

RETURN	Return from Subroutine				
Syntax:	[label]	RETUR	N		
Operands:	None				
Operation:	$TOS \to PC$				
Status Affected:	None				
Encoding:	00 0000 0000 1000				
Description:	Return from subroutine. The stack is POPed and the top of the stack (TOS) is loaded into the program counter. This is a two cycle instruction.				
Words:	1				
Cycles:	2				
Example	RETURN				
	After Inte	rrupt PC =	TOS		

Rotate Right f through Carry				
[label] RRF f,d				
$0 \le f \le 127$ $d \in [0,1]$				
See description below				
С				
00 1100 dfff ffff				
The contents of register 'f' are rotated one bit to the right through the Carry Flag. If 'd' is 0 the result is placed in the W register. If 'd' is 1 the result is placed back in register 'f'.				
1				
1				
RRF REG1,0				
Before Instruction REG1 = 1110 0110 C = 0 0 After Instruction REG1 = 1110 0110 W = 0111 0011 C = 0				

RLF Rotate Left f through Carry Syntax: [label] RLF f,d Operands: $0 \le f \le 127$ $d \in [0,1]$ Operation: See description below Status Affected: С Encoding: 00 1101 dfff ffff Description: The contents of register 'f' are rotated one bit to the left through the Carry Flag. If 'd' is 0 the result is placed in the W register. If 'd' is 1 the result is stored back in register 'f'. Register f Words: 1 Cycles: Example RLF REG1,0 Before Instruction REG1 1110 0110 С 0 After Instruction REG1 1110 0110 W 1100 1100 С

SLEEP			
Syntax:	[label] SLEEP		
Operands:	None		
Operation:	$\begin{array}{l} \text{00h} \rightarrow \text{WDT,} \\ \text{0} \rightarrow \text{WDT prescaler,} \\ \text{1} \rightarrow \overline{\text{TO}}, \\ \text{0} \rightarrow \overline{\text{PD}} \end{array}$		
Status Affected:	TO, PD		
Encoding:	00 0000 0110 0011		
Description:	The power-down status bit, PD is cleared. Time-out status bit, TO is set. Watchdog Timer and its prescaler are cleared. The processor is put into SLEEP mode with the oscillator stopped.		
Words:	1		
Cycles:	1		
Example:	SLEEP		

SUBLW	Subtract W from Literal	SUBWF	Subtract W from f	
Syntax:	[label] SUBLW k	Syntax:	[label] SUBWF f,d	
Operands:	$0 \le k \le 255$	Operands:	$0 \le f \le 127$	
Operation:	$k - (W) \rightarrow (W)$		d ∈ [0,1]	
Status	C, DC, Z	Operation:	(f) - (W) \rightarrow (dest)	
Affected:		Status	C, DC, Z	
Encoding:	11 110x kkkk kkkk	Affected:		
Description:	The W register is subtracted (2's com-	Encoding:	00 0010 dfff ffff	
	plement method) from the eight bit literal 'k'. The result is placed in the W register.	Description:	Subtract (2's complement method) W register from register 'f'. If 'd' is 0 the result is	
Words:	1		stored in the W register. If 'd' is 1 the result is stored back in register 'f'.	
Cycles:	1	Words:	1	
Example 1:	SUBLW 0x02	Cycles:	1	
	Before Instruction	Example 1:	' SUBWF REG1,1	
	W = 1 C = ?	Example 1.	Before Instruction	
			REG1 = 3

			W = 2 C = ?	
			After Instruction	
			REG1 = 0xFF	
			W = 2 C = 0; result is negative	
			o – o, result is negative	

SWAPF	Swap Nibbles in f				
Syntax:	[label] SWAPF f,d				
Operands:	$0 \le f \le 127$ $d \in [0,1]$				
Operation:	$(f<3:0>) \rightarrow (dest<7:4>),$ $(f<7:4>) \rightarrow (dest<3:0>)$				
Status Affected:	None				
Encoding:	00 1110 dfff	ffff			
Description:	The upper and lower nibbles of register 'f' are exchanged. If 'd' is 0 the result is placed in W register. If 'd' is 1 the result is placed in register 'f'.				
Words:	1				
Cycles:	1				
Example	SWAPF REG, 0				
	Before Instruction				
	REG1 = 0xAs	5			
	After Instruction				
	REG1 = 0xA5 $ W = 0x5A$	-			

XORLW	Exclusive OR Literal with W
Syntax:	[label] XORLW k
Operands:	$0 \le k \le 255$
Operation:	(W) .XOR. $k \rightarrow (W)$
Status Affected:	Z
Encoding:	11 1010 kkkk kkkk
Description:	The contents of the W register are XOR'ed with the eight bit literal 'k'. The result is placed in the W register.
Words:	1
Cycles:	1
Example:	XORLW 0xAF
	Before Instruction
	W = 0xB5
	After Instruction
	W = 0x1A

TRIS	Load TRIS Register		
Syntax:	[label] TRIS f		
Operands:	$5 \le f \le 7$		
Operation:	$\text{(W)} \rightarrow \text{TRIS register f;}$		
Status Affected:	None		
Encoding:	00 0000 0110 Of	ff	
Description:	The instruction is supported for co- compatibility with the PIC16C5X p ucts. Since TRIS registers are rea able and writable, the user can dir- address them.	orod- ad-	
Words:	1		
Cycles:	1		
Example			
	To maintain upward compatibil with future PIC12C67X product do not use this instruction.	•	

XORWF	Exclusive OR W with f			
Syntax:	[label]	XORWF	f,d	
Operands:	$0 \le f \le 127$ $d \in [0,1]$			
Operation:	(W) .XOR	$R. (f) \rightarrow (c)$	dest)	
Status Affected:	Z			
Encoding:	0.0	0110	dfff	ffff
Description:	Exclusive of register with result is storight is 1 the result.	th register	r 'f'. If 'd e W reg	I' is 0 the
Words:	1			
Cycles:	1

	After Instruction			
		REG W	= =	0x1A 0xB5

PIC12C67X

NOTES:

10.0 DEVELOPMENT SUPPORT

10.1 <u>Development Tools</u>

The PICmicro[™] microcontrollers are supported with a full range of hardware and software development tools:

- PICMASTER/PICMASTER CE Real-Time In-Circuit Emulator
- ICEPIC Low-Cost PIC16C5X and PIC16CXXX In-Circuit Emulator
- PRO MATE® II Universal Programmer
- PICSTART[®] Plus Entry-Level Prototype Programmer
- PICDEM-1 Low-Cost Demonstration Board
- PICDEM-2 Low-Cost Demonstration Board
- PICDEM-3 Low-Cost Demonstration Board
- MPASM Assembler
- MPLAB™ SIM Software Simulator
- MPLAB-C (C Compiler)
- Fuzzy Logic Development System (fuzzyTECH[®]–MP)

10.2 PICMASTER: High Performance Universal In-Circuit Emulator with MPLAB IDE

The PICMASTER Universal In-Circuit Emulator is intended to provide the product development engineer with a complete microcontroller design tool set for all microcontrollers in the PIC12CXXX, PIC14C000, PIC16C5X, PIC16CXXX and PIC17CXX families. PICMASTER is supplied with the MPLAB™ Integrated Development Environment (IDE), which allows editing, "make" and download, and source debugging from a single environment.

Interchangeable target probes allow the system to be easily reconfigured for emulation of different processors. The universal architecture of the PICMASTER allows expansion to support all new Microchip microcontrollers.

The PICMASTER Emulator System has been designed as a real-time emulation system with advanced features that are generally found on more expensive development tools. The PC compatible 386 (and higher) machine platform and Microsoft Windows® 3.x environment were chosen to best make these features available to you, the end user.

A CE compliant version of PICMASTER is available for European Union (EU) countries.

10.3 <u>ICEPIC: Low-Cost PIC16CXXX</u> In-Circuit Emulator

ICEPIC is a low-cost in-circuit emulator solution for the Microchip PIC16C5X and PIC16CXXX families of 8-bit OTP microcontrollers.

ICEPIC is designed to operate on PC-compatible machines ranging from 286-AT[®] through Pentium™ based machines under Windows 3.x environment. ICEPIC features real time, non-intrusive emulation.

10.4 PRO MATE II: Universal Programmer

The PRO MATE II Universal Programmer is a full-featured programmer capable of operating in stand-alone mode as well as PC-hosted mode.

The PRO MATE II has programmable VDD and VPP supplies which allows it to verify programmed memory at VDD min and VDD max for maximum reliability. It has an LCD display for displaying error messages, keys to enter commands and a modular detachable socket assembly to support various package types. In standalone mode the PRO MATE II can read, verify or program PIC12CXXX, PIC14C000, PIC16C5X, PIC16CXXX and PIC17CXX devices. It can also set configuration and code-protect bits in this mode.

10.5 <u>PICSTART Plus Entry Level</u> <u>Development System</u>

The PICSTART programmer is an easy-to-use, low-cost prototype programmer. It connects to the PC via one of the COM (RS-232) ports. MPLAB Integrated Development Environment software makes using the programmer simple and efficient. PICSTART Plus is not recommended for production programming.

PICSTART Plus supports all PIC12CXXX, PIC14C000, PIC16C5X, PIC16CXXX and PIC17CXX devices with up to 40 pins. Larger pin count devices such as the PIC16C923 and PIC16C924 may be supported with an adapter socket.

10.6 PICDEM-1 Low-Cost PIC16/17 Demonstration Board

The PICDEM-1 is a simple board which demonstrates the capabilities of several of Microchip's microcontrollers. The microcontrollers supported are: PIC16C5X (PIC16C54 to PIC16C58A), PIC16C61, PIC16C62X, PIC16C71, PIC16C8X, PIC17C42, PIC17C43 and PIC17C44. All necessary hardware and software is included to run basic demo programs. The users can program the sample microcontrollers provided with the PICDEM-1 board, on a PRO MATE II or PICSTART-Plus programmer, and easily test firmware. The user can also connect the PICDEM-1 board to the PICMASTER emulator and download the firmware to the emulator for testing. Additional prototype area is available for the user to build some additional hardware and connect it to the microcontroller socket(s). Some of the features include an RS-232 interface, a potentiometer for simulated analog input, push-button switches and eight LEDs connected to PORTB.

10.7 PICDEM-2 Low-Cost PIC16CXX Demonstration Board

The PICDEM-2 is a simple demonstration board that supports the PIC16C62, PIC16C64, PIC16C65, PIC16C73 and PIC16C74 microcontrollers. All the necessary hardware and software is included to run the basic demonstration programs. The user can program the sample microcontrollers provided with the PICDEM-2 board, on a PRO MATE II programmer or PICSTART-Plus, and easily test firmware. The PICMASTER emulator may also be used with the PICDEM-2 board to test firmware. Additional prototype area has been provided to the user for adding additional hardware and connecting it to the microcontroller socket(s). Some of the features include a RS-232 interface, push-button switches, a potentiometer for simulated analog input, a Serial EEPROM to demonstrate usage of the I²C bus and separate headers for connection to an LCD module and a keypad.

10.8 PICDEM-3 Low-Cost PIC16CXXX Demonstration Board

The PICDEM-3 is a simple demonstration board that supports the PIC16C923 and PIC16C924 in the PLCC package. It will also support future 44-pin PLCC microcontrollers with a LCD Module. All the necessary hardware and software is included to run the basic demonstration programs. The user can program the sample microcontrollers provided with the PICDEM-3 board, on a PRO MATE II programmer or PICSTART Plus with an adapter socket, and easily test firmware. The PICMASTER emulator may also be used with the PICDEM-3 board to test firmware. Additional prototype area has been provided to the user for adding hardware and connecting it to the microcontroller socket(s). Some of the features include

an RS-232 interface, push-button switches, a potentiometer for simulated analog input, a thermistor and separate headers for connection to an external LCD module and a keypad. Also provided on the PICDEM-3 board is an LCD panel, with 4 commons and 12 segments, that is capable of displaying time, temperature and day of the week. The PICDEM-3 provides an additional RS-232 interface and Windows 3.1 software for showing the demultiplexed LCD signals on a PC. A simple serial interface allows the user to construct a hardware demultiplexer for the LCD signals.

10.9 MPLAB Integrated Development Environment Software

The MPLAB IDE Software brings an ease of software development previously unseen in the 8-bit microcontroller market. MPLAB is a windows based application which contains:

- · A full featured editor
- · Three operating modes
 - editor
 - emulator
 - simulator
- · A project manager
- · Customizable tool bar and key mapping
- · A status bar with project information
- Extensive on-line help

MPLAB allows you to:

- · Edit your source files (either assembly or 'C')
- One touch assemble (or compile) and download to PIC16/17 tools (automatically updates all project information)
- · Debug using:
 - source files
 - absolute listing file
- Transfer data dynamically via DDE (soon to be replaced by OLE)
- · Run up to four emulators on the same PC

The ability to use MPLAB with Microchip's simulator allows a consistent platform and the ability to easily switch from the low cost simulator to the full featured emulator with minimal retraining due to development tools.

10.10 Assembler (MPASM)

The MPASM Universal Macro Assembler is a PC-hosted symbolic assembler. It supports all microcontroller series including the PIC12C5XX, PIC14000, PIC16C5X, PIC16CXXX, and PIC17CXX families.

MPASM offers full featured Macro capabilities, conditional assembly, and several source and listing formats. It generates various object code formats to support Microchip's development tools as well as third party programmers.

MPASM allows full symbolic debugging from PICMASTER, Microchip's Universal Emulator System.

MPASM has the following features to assist in developing software for specific use applications.

- Provides translation of Assembler source code to object code for all Microchip microcontrollers.
- · Macro assembly capability.
- Produces all the files (Object, Listing, Symbol, and special) required for symbolic debug with Microchip's emulator systems.
- Supports Hex (default), Decimal and Octal source and listing formats.

MPASM provides a rich directive language to support programming of the PIC16/17. Directives are helpful in making the development of your assemble source code shorter and more maintainable.

10.11 Software Simulator (MPLAB-SIM)

The MPLAB-SIM Software Simulator allows code development in a PC host environment. It allows the user to simulate the PIC16/17 series microcontrollers on an instruction level. On any given instruction, the user may examine or modify any of the data areas or provide external stimulus to any of the pins. The input/output radix can be set by the user and the execution can be performed in; single step, execute until break, or in a trace mode.

MPLAB-SIM fully supports symbolic debugging using MPLAB-C and MPASM. The Software Simulator offers the low cost flexibility to develop and debug code outside of the laboratory environment making it an excellent multi-project software development tool.

10.12 C Compiler (MPLAB-C)

The MPLAB-C Code Development System is a complete 'C' compiler and integrated development environment for Microchip's PIC16/17 family of microcontrollers. The compiler provides powerful integration capabilities and ease of use not found with other compilers.

For easier source level debugging, the compiler provides symbol information that is compatible with the MPLAB IDE memory display.

10.13 <u>Fuzzy Logic Development System</u> (<u>fuzzyTECH-MP</u>)

fuzzyTECH-MP fuzzy logic development tool is available in two versions - a low cost introductory version, MP Explorer, for designers to gain a comprehensive working knowledge of fuzzy logic system design; and a full-featured version, fuzzyTECH-MP, edition for implementing more complex systems.

Both versions include Microchip's fuzzyLABTM demonstration board for hands-on experience with fuzzy logic systems implementation.

10.14 <u>MP-DriveWay™ – Application Code</u> Generator

MP-DriveWay is an easy-to-use Windows-based Application Code Generator. With MP-DriveWay you can visually configure all the peripherals in a PIC16/17 device and, with a click of the mouse, generate all the initialization and many functional code modules in C language. The output is fully compatible with Microchip's MPLAB-C C compiler. The code produced is highly modular and allows easy integration of your own code. MP-DriveWay is intelligent enough to maintain your code through subsequent code generation.

10.15 <u>SEEVAL® Evaluation and Programming System</u>

The SEEVAL SEEPROM Designer's Kit supports all Microchip 2-wire and 3-wire Serial EEPROMs. The kit includes everything necessary to read, write, erase or program special features of any Microchip SEEPROM product including Smart Serials™ and secure serials. The Total Endurance™ Disk is included to aid in tradeoff analysis and reliability calculations. The total kit can significantly reduce time-to-market and result in an optimized system.

10.16 <u>Keeloq® Evaluation and</u> Programming Tools

KEELOQ evaluation and programming tools support Microchips HCS Secure Data Products. The HCS evaluation kit includes an LCD display to show changing codes, a decoder to decode transmissions, and a programming interface to program test transmitters.

11.0 ELECTRICAL CHARACTERISTICS FOR PIC12C67X

Absolute Maximum Ratings †

Ambient temperature under bias	
Storage temperature	
Voltage on any pin with respect to Vss (except VDD and MCLR)	
Voltage on VDD with respect to Vss	0 to +7.5V
Voltage on MCLR with respect to Vss (Note 2)	016 +14V
Total power dissipation (Note 1)	700 mW
Maximum current out of Vss pin	200 mA
Maximum current into VDD pin	150 mA
Input clamp current, lik (Vi < 0 or Vi > VDD)	± 20 mA
Output clamp current, lok (Vo < 0 or Vo > VDD)	± 20 mA
Maximum output current sunk by any I/O pin	25 mA
Maximum output current sunk by any I/O pin	25 mA
Maximum current sunk by GPIO pins combined	100 mA
Maximum current sourced by GPIO pins combined	
Note 1: Power dissipation is calculated as follows: Pdis ♣VDb x {Ibp → ∑ IOH} +	+ $\sum \{(VDD - VOH) \times IOH\} + \sum (VOI \times IOL).$

† NOTICE: Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

- * These parameters are characterized but not tested.
- † Data in "Typ" column is at 5 \$\frac{1}{25}\$ C unless otherwise stated. These parameters are for design guidance only and are not tested.
- Note 1: This is the limit to which NDD can be lowered in SLEEP mode without losing RAM data.
 - 2: The supply current is mainly a function of the operating voltage and frequency. Other factors such as I/O pin loading and switching rate, oscillator type, internal code execution pattern, and temperature also have an impact on the current consumption.
 - The test conditions for all NDD measurements in active operation mode are:
 - OSC1 = external square wave, from rail to rail; all I/O pins tristated, pulled to VDD
 - MCLR = VDD, WDT enabled/disabled as specified.
 - 3: The power-down current in SLEEP mode does not depend on the oscillator type. Power-down current is measured with the part in SLEEP mode, with all I/O pins in hi-impedance state and tied to VDD and Vss.
 - 4: For EXTRC osc configurations, current through Rext is not included. The current through the resistor can be estimated by the formula Ir = VDD/2Rext (mA) with Rext in kOhm.
 - 5: Extended operating range is Advance Information for this device.

	·				^	',	external clock is used to drive
						\ ,	QSC1.
D101	All I/O pins and OSC2	Cio	-		5Q \	pF\	

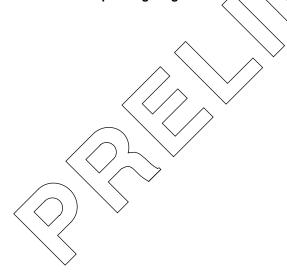

Data in "Typ" column is at 5V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

Note 1: In EXTRC oscillator configuration, the OSC1/CLKIN pin is a Schmitt Trigger input. It is not recommended that the PIC12C67X be driven with external clock in RC mode.

2: The leakage current on the MCLR pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current may be measured at different input voltages.

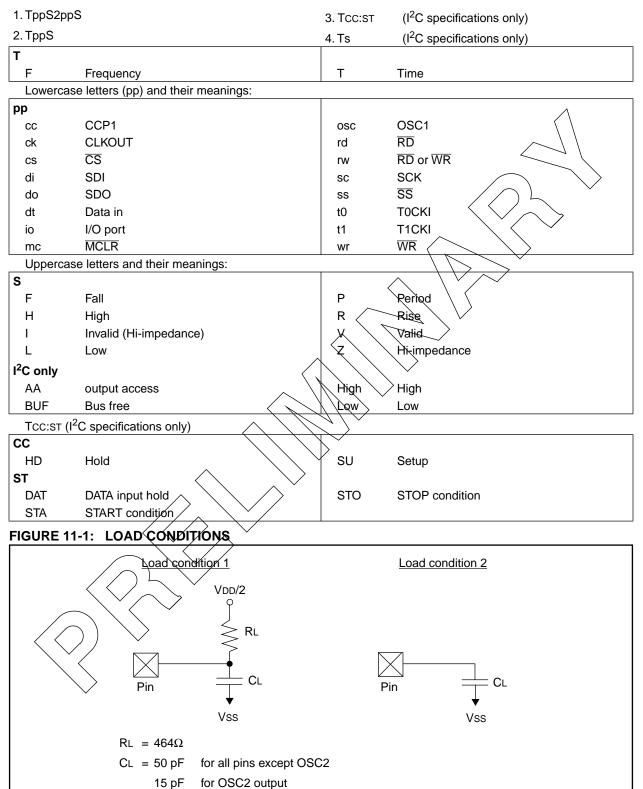

3: Negative current is defined as coming out of the pin.

4: Extended operating range is Advance information for this device.

11.4 <u>Timing Parameter Symbology</u>

The timing parameter symbols have been created following one of the following formats:

11.5 <u>Timing Diagrams and Specifications</u>

FIGURE 11-2: EXTERNAL CLOCK TIMING

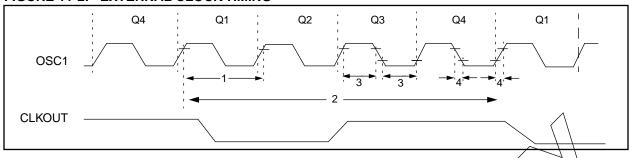

TABLE 11-2: CLOCK TIMING REQUIREMENTS

Parameter	Sym	Characteristic	Min	Typ†	Max	Units	Conditions
No.

			250	<u> </u>	250	ns	HS osc mode (PIC12C67X-04)
			100	_	250	ns	HS osc mode (PIC12C67X-10)
			Š	_	_	μs	LP osc mode
2	Tcy	Instruction Cycle Time (Note 1)	200	_	DC	ns	Tcy = 4/Fosc
3	TosL,	External Clock in (OSC1) High	50	_	_	ns	XT oscillator
	TosH	or Low Time	2.5	_	_	μs	LP oscillator
			10	_	_	ns	HS oscillator
4	TosR,	External Clock in (OSC1) Rise	_	_	25	ns	XT oscillator
	TosF <	or Fall Time	_	—	50	ns	LP oscillator
			_		15	ns	HS oscillator

[†] Data in "Typ" column is at 5V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

ote 1: Instruction cycle period (Tcy) equals four times the input oscillator time-base period. All specified values are based on characterization data for that particular oscillator type under standard operating conditions with the device executing code. Exceeding these specified limits may result in an unstable oscillator operation and/or higher than expected current consumption. All devices are tested to operate at "min." values with an external clock applied to the OSC1/CLKIN pin. When an external clock input is used, the "Max." cycle time limit is "DC" (no clock) for all devices. OSC2 is disconnected (has no loading) for the PIC12C67X.

FIGURE 11-3: CLKOUT AND I/O TIMING

NOTES:

12.0 DC AND AC CHARACTERISTICS - PIC12C67X

The graphs and tables provided in this section are for design guidance and are not tested or guaranteed. In some graphs or tables the data presented are outside specified operating range (e.g., outside specified VDD range). This is for information only and devices will operate properly only within the specified range.

The data presented in this section is a statistical summary of data collected on units from different lots over a period of time. "Typical" represents the mean of the distribution while "max" or "min" represents (mean + 3 σ) and (mean - 3 σ) respectively, where σ is standard deviation.

13.0 PACKAGING INFORMATION

13.1 Package Marking Information

8-Lead PDIP (300 mil)

8-Lead SOIC (208 mil)

8-Lead Windowed Ceramic Side Brazed (300 mil)

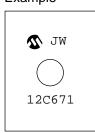

Example

Example

Example

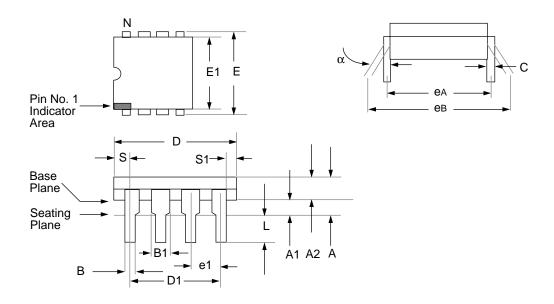

Legend: MMM	Microchip part number information
XXX	Customer specific information*
AA	Year code (last 2 digits of calendar year)
BB	Week code (week of January 1 is week '01')
С	Facility code of the plant at which wafer is manufactured
	C = Chandler, Arizona, U.S.A.,
	S = Tempe, Arizona, U.S.A.
	T = Tempe, Arizona, U.S.A.
D	Mask revision number
E	Assembly code of the plant or country of origin in which
	part was assembled

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line thus limiting the number of available characters for customer specific information.

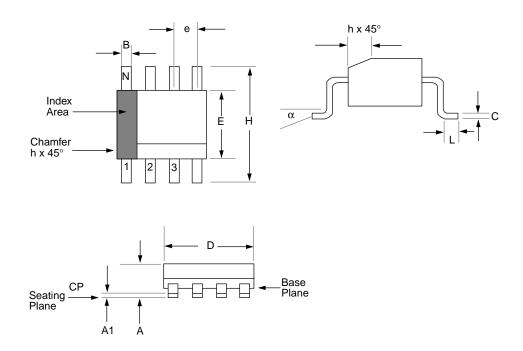

* Standard OTP marking consists of Microchip part number, year code, week code, facility code, mask rev#, and assembly code. For OTP marking beyond this, certain price adders apply. Please check with your Microchip Sales Office. For QTP devices, any special marking adders are included in QTP price.

APPENDIX A: COMPATIBILITY

To convert code written for PIC16C5X to PIC12C67X, the user should take the following steps:

- Remove any program memory page select operations (PA2, PA1, PA0 bits) for CALL, GOTO.
- 2. Revisit any computed jump operations (write to PC or add to PC, etc.) to make sure page bits are set properly under the new scheme.
- 3. Eliminate any data memory page switching. Redefine data variables to reallocate them.
- 4. Verify all writes to STATUS, OPTION, and FSR registers since these have changed.
- 5. Change reset vector to 0000h.

NOTES:

ON-LINE SUPPORT

Microchip provides two methods of on-line support. These are the Microchip BBS and the Microchip World Wide Web (WWW) site.

Use Microchip's Bulletin Board Service (BBS) to get current information and help about Microchip products. Microchip provides the BBS communication channel for you to use in extending your technical staff with microcontroller and memory experts.

To provide you with the most responsive service possible, the Microchip systems team monitors the BBS, posts the latest component data and software tool updates, provides technical help and embedded systems insights, and discusses how Microchip products provide project solutions.

The web site, like the BBS, is used by Microchip as a means to make files and information easily available to customers. To view the site, the user must have access to the Internet and a web browser, such as Netscape or Microsoft Explorer. Files are also available for FTP download from our FTP site.

Connecting to the Microchip Internet Web Site

The Microchip web site is available by using your favorite Internet browser to attach to:

www.microchip.com

The file transfer site is available by using an FTP service to connect to:

ftp://ftp.futureone.com/pub/microchip

The web site and file transfer site provide a variety of services. Users may download files for the latest Development Tools, Data Sheets, Application Notes, User's Guides, Articles and Sample Programs. A variety of Microchip specific business information is also available, including listings of Microchip sales offices, distributors and factory representatives. Other data available for consideration is:

- Latest Microchip Press Releases
- Technical Support Section with Frequently Asked Questions
- · Design Tips
- · Device Errata
- Job Postings
- Microchip Consultant Program Member Listing
- Links to other useful web sites related to Microchip Products

Connecting to the Microchip BBS

Connect worldwide to the Microchip BBS using either the Internet or the CompuServe® communications network.

Internet:

You can telnet or ftp to the Microchip BBS at the address: **mchipbbs.microchip.com**

CompuServe Communications Network:

When using the BBS via the Compuserve Network, in most cases, a local call is your only expense. The Microchip BBS connection does not use CompuServe membership services, therefore you do not need CompuServe membership to join Microchip's BBS. There is no charge for connecting to the Microchip BBS.

The procedure to connect will vary slightly from country to country. Please check with your local CompuServe agent for details if you have a problem. CompuServe service allow multiple users various baud rates depending on the local point of access.

The following connect procedure applies in most locations.

- Set your modem to 8-bit, No parity, and One stop (8N1). This is not the normal CompuServe setting which is 7E1.
- 2. Dial your local CompuServe access number.
- Depress the **<Enter>** key and a garbage string will appear because CompuServe is expecting a 7E1 setting.
- Type +, depress the <Enter> key and "Host Name:" will appear.
- Type MCHIPBBS, depress the **<Enter>** key and you will be connected to the Microchip BBS.

In the United States, to find the CompuServe phone number closest to you, set your modem to 7E1 and dial (800) 848-4480 for 300-2400 baud or (800) 331-7166 for 9600-14400 baud connection. After the system responds with "Host Name:", type NETWORK, depress the **<Enter>** key and follow CompuServe's directions.

For voice information (or calling from overseas), you may call (614) 723-1550 for your local CompuServe number.

Microchip regularly uses the Microchip BBS to distribute technical information, application notes, source code, errata sheets, bug reports, and interim patches for Microchip systems software products. For each SIG, a moderator monitors, scans, and approves or disapproves files submitted to the SIG. No executable files are accepted from the user community in general to limit the spread of computer viruses.

Systems Information and Upgrade Hot Line

The Systems Information and Upgrade Line provides system users a listing of the latest versions of all of Microchip's development systems software products. Plus, this line provides information on how customers can receive any currently available upgrade kits. The Hot Line Numbers are:

1-800-755-2345 for U.S. and most of Canada, and 1-602-786-7302 for the rest of the world.

970301

READER RESPONSE

It is our intention to provide you with the best documentation possible to ensure successful use of your Microchip product. If you wish to provide your comments on organization, clarity, subject matter, and ways in which our documentation can better serve you, please FAX your comments to the Technical Publications Manager at (602) 786-7578.

Please list the following information, and use this outline to provide us with your comments about this Data Sheet.

IO: RE:	reoninear r abheatarte manager	Total Pages Sent

8.	How would you improve our software, systems, and silicon products?						

PIC12C67X PRODUCT IDENTIFICATION SYSTEM

Please contact your local sales office for exact ordering procedures.

Sales and Support

Products supported by a preliminary Data Sheet may possibly have an errata sheet describing minor operational differences and recommended workarounds. To determine if an errata sheet exists for a particular device, please contact one of the following:

- 1. Your local Microchip sales office (see below)
- 2. The Microchip Corporate Literature Center U.S. FAX: (602) 786-7277
- 3. The Microchip's Bulletin Board, via your local CompuServe number (CompuServe membership NOT required).

Please specify which device, revision of silicon and Data Sheet (include Literature #) you are using.

For latest version information and upgrade kits for Microchip Development Tools, please call 1-800-755-2345 or 1-602-786-7302.
