

# TA7765AF

## AM / FM IF SYSTEM (1.5V USE)

The TA7765AF is an AM / FM IF system IC designed for low voltage operation (1.5V), which is especially suitable for a stereo headphone radio and a radio cassette recorder. This IC can realize the low power dissipation and few external parts.

### FEATURES

- Including the AM / FM switch.
- Including the single output terminal for AM / FM.
- Including the LED driver for tuning indicator.  
( $V_{LED} \geq 2.5V$ )
- Few external parts and small installed area.
- Excellent supply current : ( $V_{CC} = 1.5V, T_a = 25^\circ C$ )  
AM :  $I_{CC} = 1.1mA$  (Typ.)  
FM :  $I_{CC} = 1.8mA$  (Typ.)
- Operating supply voltage range.  
:  $V_{CC} (opr) = 0.95 \sim 5V$  ( $T_a = 25^\circ C$ )

SSOP16-P-225-1.00A  
Weight : 0.14g (Typ.)

● TOSHIBA is continually working to improve the quality and the reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to observe standards of safety, and to avoid situations in which a malfunction or failure of a TOSHIBA product could cause loss of human life, bodily injury or damage to property. In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent products specifications. Also, please keep in mind the precautions and conditions set forth in the TOSHIBA Semiconductor Reliability Handbook.

**APPLICATION NOTE**

**(1) FM-IF input stage**

The terminal pin① is the FM-IF input terminal which is the base of common-emitter transistor. (Fig.1)

**(2) FM-IF stage**

This is composed of the six stage of the common-emitter amplifiers with active loads. As the third stage and the fourth stage are connected with internal coupling condenser, it is composed of HPF. Therefore, it is possible to reduce the noise of low frequency range.

**(3) AM input stage**

The terminal pin⑭ is the AM input terminal which is the base of common-emitter transistor. And this transistor is the current source of the Mixer which is composed of emitter coupled pair transistors. (Fig.2)

**(4) AM-IF input stage**

The AM-IF signal from the MIX OUT terminal (pin⑫) is applied to the AM-IF input terminal (pin⑩) through the transformer. The terminal pin⑩ is the base of common-emitter transistor, and the input resistance is  $3k\Omega$  (Typ.).

**(5) AGC circuit**

This AGC circuit is composed of the internal Double-AGC get high applied widely.

- ┌ medium input : AGC applied to IF section.
- └ strong input : AGC applied to RF and IF section.

(6) Output buffer amplifier (AF)

The output impedance differs in FM/AM mode. At FM mode, it is low output impedance due to pass the sub-carrier. On the other hand, at AM mode, it is high output impedance due to high frequency-cut easily.

$$R_{OUT} (FM) = 1.3k\Omega \text{ (Typ.)}$$

$$R_{OUT} (AM) = 8k\Omega \text{ (Typ.)}$$

(7) LED driver

Fig.4 shows the LED driver.

The "LED supply voltage" must be more than about 2.5V, for using this function.

Without the LED, it is necessary to connect the terminal pin④ to GND, then the supply current is reduced.

(8) FM/AM mode switch circuit

When the terminal pin⑮ is connected to VCC directly, the FM mode is given, and when this terminal is opened, the AM mode is given.

In case of connecting as Fig.5, one-circuit switch is enough to stop the VCO at AM mode.
