## Audio-switched operational amplifier (2 inputs, 1 output)

The BA3128N and BA3128F are operational amplifiers provided with an analog switch. This enables the gain of the amplifiers to be switched at the same time as the inputs to the amplifiers.

Control of the gain is controlled externally by setting one of the pins ON or OFF.

The ICs can be powered by single or dual power supplies.

### Features

- available in SIP8 and SOP8 packages
- single power supply: 5 ~ 32 V  
dual power supply:  $\pm 2.5 \sim \pm 16$  V
- low noise:  $V_N = 2.0 \mu V_{rms}$  typically
- low switching noise
- high gain and low distortion:  
 $G_{VO} = 110$  dB, THD = 0.0015%

### Applications

- video tape recorders
- amplifiers

Figure 10 Application example

The input switch is operated by the external switch. When the external switch (SW) is OFF, the A-channel functions. When the external switch (SW) is ON, the B-channel functions. The pin voltage (V) of the control pin is

$$V \cong V_{CC} - (5 \times 10^3 + 10 \times 10^3) I - 0.7$$

Therefore, make sure to select R1 and R2 such that when SW is OFF, the switch current (I) is below 1  $\mu\text{A}$  and when SW is ON, the switch current (I) is above 20  $\mu\text{A}$  (see Figure 10).
