

# USBLC6-4SC6

ASD

(Application Specific Devices)

## VERY LOW CAPACITANCE ESD PROTECTION

### MAIN APPLICATIONS

- USB2.0 ports up to 480Mb/s (high speed)
- Backwards compatible with USB1.1 low and full speed
- Ethernet port: 10/100Mb/s
- SIM card protection
- Video line protection
- Portable electronics

### DESCRIPTION

The **USBLC6-4SC6** is a monolithic Application Specific Discrete dedicated to ESD protection of high speed interfaces, such as USB2.0, Ethernet links and Video lines.

Its very low line capacitance secures a high level of signal integrity without compromising in protecting sensitive chips against the most stringent characterized ESD strikes.

### FEATURES

- 4 data lines protection
- Protects  $V_{BUS}$
- Very low capacitance: 3pF typ.
- SOT23-6L package
- RoHS compliant

### BENEFITS

- Very low capacitance between lines to GND for optimized data integrity and speed
- Low PCB space consuming, 9mm<sup>2</sup> maximum foot print
- Enhanced ESD protection
- IEC61000-4-2 level 4 compliance guaranteed at device level, hence greater immunity at system level
- ESD protection of  $V_{BUS}$ . Allows ESD current flowing to Ground when ESD event occurs on data line
- High reliability offered by monolithic integration
- Low leakage current for longer operation of battery powered devices
- Fast response time
- Consistent D+ / D- signal balance:
  - Best capacitance matching tolerance
  - I/O to GND = 0.015pF
  - Compliant with USB 2.0 requirements < 1pF

Part Number	Marking
USBLC6-4SC6	UL46

### COMPLIES WITH THE FOLLOWING STANDARDS:

- IEC61000-4-2 level4:
  - 15kV (air discharge)
  - 8kV (contact discharge)

## USBLC6-4SC6

**Table 2: Absolute Ratings**

Symbol	Parameter		Value	Unit
$V_{PP}$	Peak pulse voltage	At device level: IEC61000-4-2 air discharge IEC61000-4-2 contact discharge MIL STD883C-Method 3015-6	15 15 25	kV
$T_{stg}$	Storage temperature range		-55 to +150	°C
$T_j$	Maximum junction temperature		125	°C
$T_L$	Lead solder temperature (10 seconds duration)		260	°C

**TECHNICAL INFORMATION**

**1. SURGE PROTECTION**

The USBLC6-4SC6 is particularly optimized to perform surge protection based on the rail to rail topology. The clamping voltage  $V_{CL}$  can be calculated as follow :

$$V_{CL+} = V_{BUS} + V_F \text{ for positive surges}$$

$$V_{CL-} = - V_F \text{ for negative surges}$$

with:  $V_F = V_T + R_d \cdot I_p$   
 ( $V_F$  forward drop voltage) / ( $V_T$  forward drop threshold voltage)

We assume that the value of the dynamic resistance of the clamping diode is typically:  
 $R_d = 1.4\Omega$  and  $V_T = 1.2V$ .

For an IEC61000-4-2 surge Level 4 (Contact Discharge:  $V_g=8kV$ ,  $R_g=330\Omega$ ),  $V_{BUS} = +5V$ , and if in first approximation, we assume that :  $I_p = V_g / R_g = 24A$ .

So, we find:

$$V_{CL+} = +39V$$

$$V_{CL-} = -34V$$

**Note:** the calculations do not take into account phenomena due to parasitic inductances.

**2. SURGE PROTECTION APPLICATION EXAMPLE**

If we consider that the connections from the pin  $V_{BUS}$  to  $V_{CC}$  and from GND to PCB GND are done by two tracks of 10mm long and 0.5mm large; we assume that the parasitic inductances  $L_w$  of these tracks are about 6nH. So when an IEC61000-4-2 surge occurs, due to the rise time of this spike ( $tr=1ns$ ), the voltage  $V_{CL}$  has an extra value equal to  $L_w \cdot di/dt$ .

The  $di/dt$  is calculated as:  $di/dt = I_p/tr = 24 A/ns$

The overvoltage due to the parasitic inductances is:  $L_w \cdot di/dt = 6 \times 24 = 144V$

By taking into account the effect of these parasitic inductances due to unsuitable layout, the clamping voltage will be :

$$V_{CL+} = +39 + 144 = 183V$$

$$V_{CL-} = -34 - 144 = -178V$$

We can reduce as much as possible these phenomena with simple layout optimization.

It's the reason why some recommendations have to be followed (see paragraph "How to ensure a good ESD protection").

**Figure 6: ESD behavior; parasitic phenomena due to unsuitable layout**

### 3. HOW TO ENSURE A GOOD ESD PROTECTION

While the USBLC6-4SC6 provides a high immunity to ESD surge, an efficient protection depends on the layout of the board. In the same way, with the rail to rail topology, the track from the  $V_{BUS}$  pin to the power supply  $+V_{CC}$  and from the  $V_{BUS}$  pin to GND must be as short as possible to avoid overvoltages due to parasitic phenomena (see figure 6).

It's often harder to connect the power supply near to the USBLC6-4SC6 unlike the ground thanks to the ground plane that allows a short connection.

To ensure the same efficiency for positive surges when the connections can't be short enough, we recommend to put close to the USBLC6-4SC6, between  $V_{BUS}$  and ground, a capacitance of 100nF to prevent from these kinds of overvoltage disturbances (see figure 7).

The add of this capacitance will allow a better protection by providing during surge a constant voltage.

The figures 8, 9 and 10 show the improvement of the ESD protection according to the recommendations described above.

**Figure 7: ESD behavior: optimized layout and add of a capacitance of 100nF**

**Figure 8: ESD behavior: measurements conditions (with coupling capacitance)**

**Figure 9: Remaining voltage after the USBLC6-4SC6 during positive ESD surge**

**Figure 10: Remaining voltage after the USBLC6-4SC6 during negative ESD surge**

**IMPORTANT:**

A main precaution to take is to put the protection device closer to the disturbance source (generally the connector).

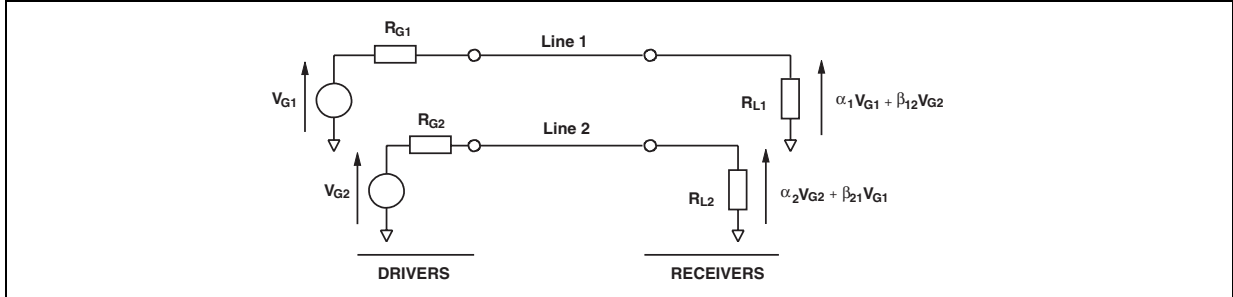

**Note:** The measurements have been done with the USBLC6-4SC6 in open circuit.

4. CROSSTALK BEHAVIOR

4.1. Crosstalk phenomena

Figure 11: Crosstalk phenomena

The crosstalk phenomena are due to the coupling between 2 lines. The coupling factor ( $\beta_{12}$  or  $\beta_{21}$ ) increases when the gap across lines decreases, particularly in silicon dice. In the example above the expected signal on load  $R_{L2}$  is  $\alpha_2 V_{G2}$ , in fact the real voltage at this point has got an extra value  $\beta_{21} V_{G1}$ . This part of the  $V_{G1}$  signal represents the effect of the crosstalk phenomenon of the line 1 on the line 2. This phenomenon has to be taken into account when the drivers impose fast digital data or high frequency analog signals in the disturbing line. The perturbed line will be more affected if it works with low voltage signal or high load impedance (few  $k\Omega$ ).

Figure 12: Analog crosstalk measurements

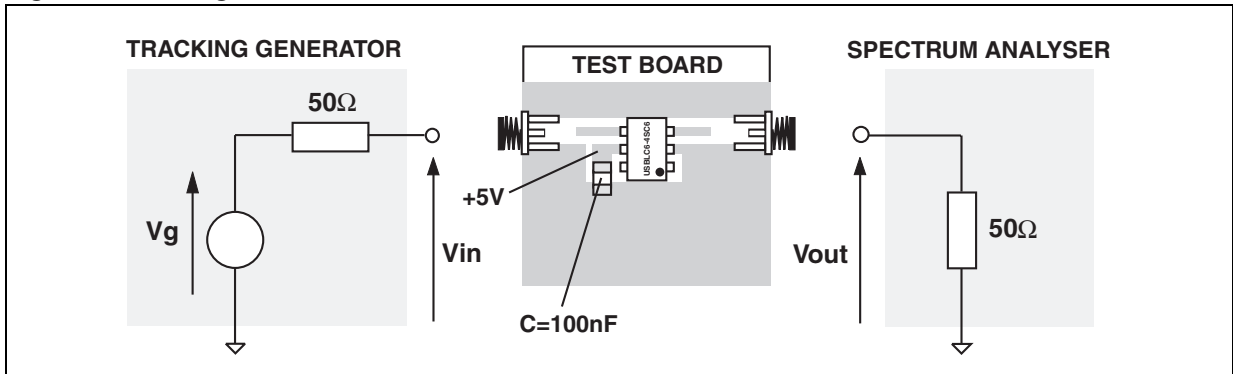

Figure 12 gives the measurement circuit for the analog application. In usual frequency range of analog signals (up to 240MHz) the effect on disturbed line is less than -55 dB (please see figure 13).

Figure 13: Analog crosstalk results

As the USBLC6-4SC6 is designed to protect high speed data lines, it must ensure a good transmission of operating signals. The frequency response (figure 5) gives attenuation information and shows that the USBLC6-4SC6 is well suitable for data line transmission up to 480 Mbit/s while it works as a filter for undesirable signals like GSM (900MHz) frequencies, for instance.
