TC40H259P/F

TC40H259 8-BIT ADDRESSABLE LATCH

The TC40H259 is an 8-bit addressable latch having one common input line and eight independent output lines.

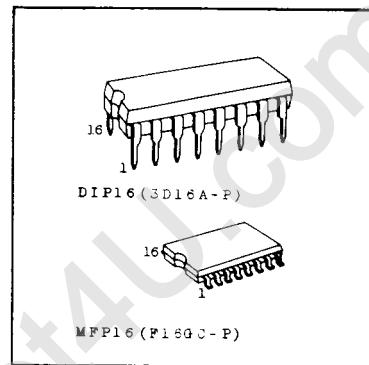

The respective bits are controlled by LATCH SELECT inputs (A, B and C).

When CLEAR input is at "H" level and ENABLE(\bar{G}) input is at "L" level, the data is written into the bit selected by LATCH SELECT inputs (A, B and C). In this case, the other bits hold their previous conditions.

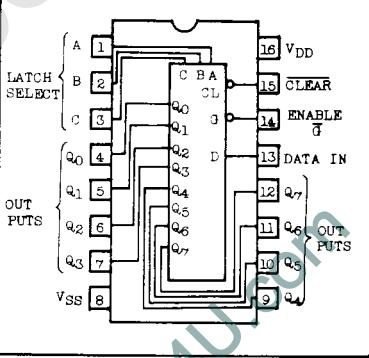

When both of CLEAR input and ENABLE(\bar{G}) input go to "H" level, write of all bits is inhibited regardless of LATCH SELECT input, and their previous conditions are held.

When CLEAR input is set to "L" level and ENABLE(\bar{G}) input is set to "H" level, all bits are reset to "L" level regardless of the other inputs.

The pin assignment and function of this latch are the same as those of the LS-TTL 74LS259.
