

V850/SA1™

32-BIT SINGLE-CHIP MICROCONTROLLER

DESCRIPTION

The μ PD70F3015B, 70F3015BY, 70F3017A, and 70F3017AY are products with on-chip flash memory. Because the devices can be programmed by the user on-board, they are ideal for the evaluation stages of system development, small-scale production of a variety of products, and rapid development of new products.

The V850/SA1 provides a high-level cost performance ideal for applications ranging from low-power camcorders and other AV equipment to portable telephone equipment such as cellular phones and personal handyphone systems (PHS).

Detailed function descriptions are provided in the following user's manuals. Be sure to read them before designing.

V850/SA1 User's Manual Hardware: U12768E
V850 Family™ User's Manual Architecture: U10243E

FEATURES

- Number of instructions: 74
- Minimum instruction execution time:
 - 58.8 ns (@ 17 MHz operation with main system clock (f_{xx}))
 - 50 ns (@ 20 MHz operation with main system clock (f_{xx}))
 - 30.5 μ s (@ 32.768 kHz operation with subsystem clock (f_{xT}))
- General-purpose registers: 32 bits \times 32 registers
- Instruction set:
 - Signed multiplication, saturation operations, 32-bit shift instructions, bit manipulation instructions, load/store instructions
- Memory space:
 - 16 MB linear address space
 - Memory block division function: 2 MB per block
- Internal memory
 - Flash memory
 - 128 KB (μ PD70F3015B, 70F3015BY)
 - 256 KB (μ PD70F3017A, 70F3017AY)
 - RAM
 - 4 KB (μ PD70F3015B, 70F3015BY)
 - 8 KB (μ PD70F3017A, 70F3017AY)
- External bus interface: 16-bit data bus
Address bus: Separate output enabled
- Interrupts and exceptions
External: 8, internal: 23, exceptions: 1
- I/O lines Total: 85
- Timer/counters
 - 16-bit timer: 2 channels
 - 8-bit timer: 4 channels
- Watch timer: 1 channel
- Watchdog timer: 1 channel
- Serial interface (SIO)
 - Asynchronous serial interface (UART)
 - Clocked serial interface (CSI)
 - I²C bus interface (μ PD70F3015BY, 70F3017AY)
- A/D converter: 12 channels
- DMA controller: 3 channels
- RTP: 8 bits \times 1 channel or 4 bits \times 2 channels
- Power-saving functions: HALT/IDLE/STOP modes
- Packages: 100-pin plastic LQFP (14 \times 14 mm)
121-pin plastic FBGA (12 \times 12 mm)

The information in this document is subject to change without notice. Before using this document, please confirm that this is the latest version.
Not all devices/types available in every country. Please check with local NEC representative for availability and additional information.

APPLICATIONS

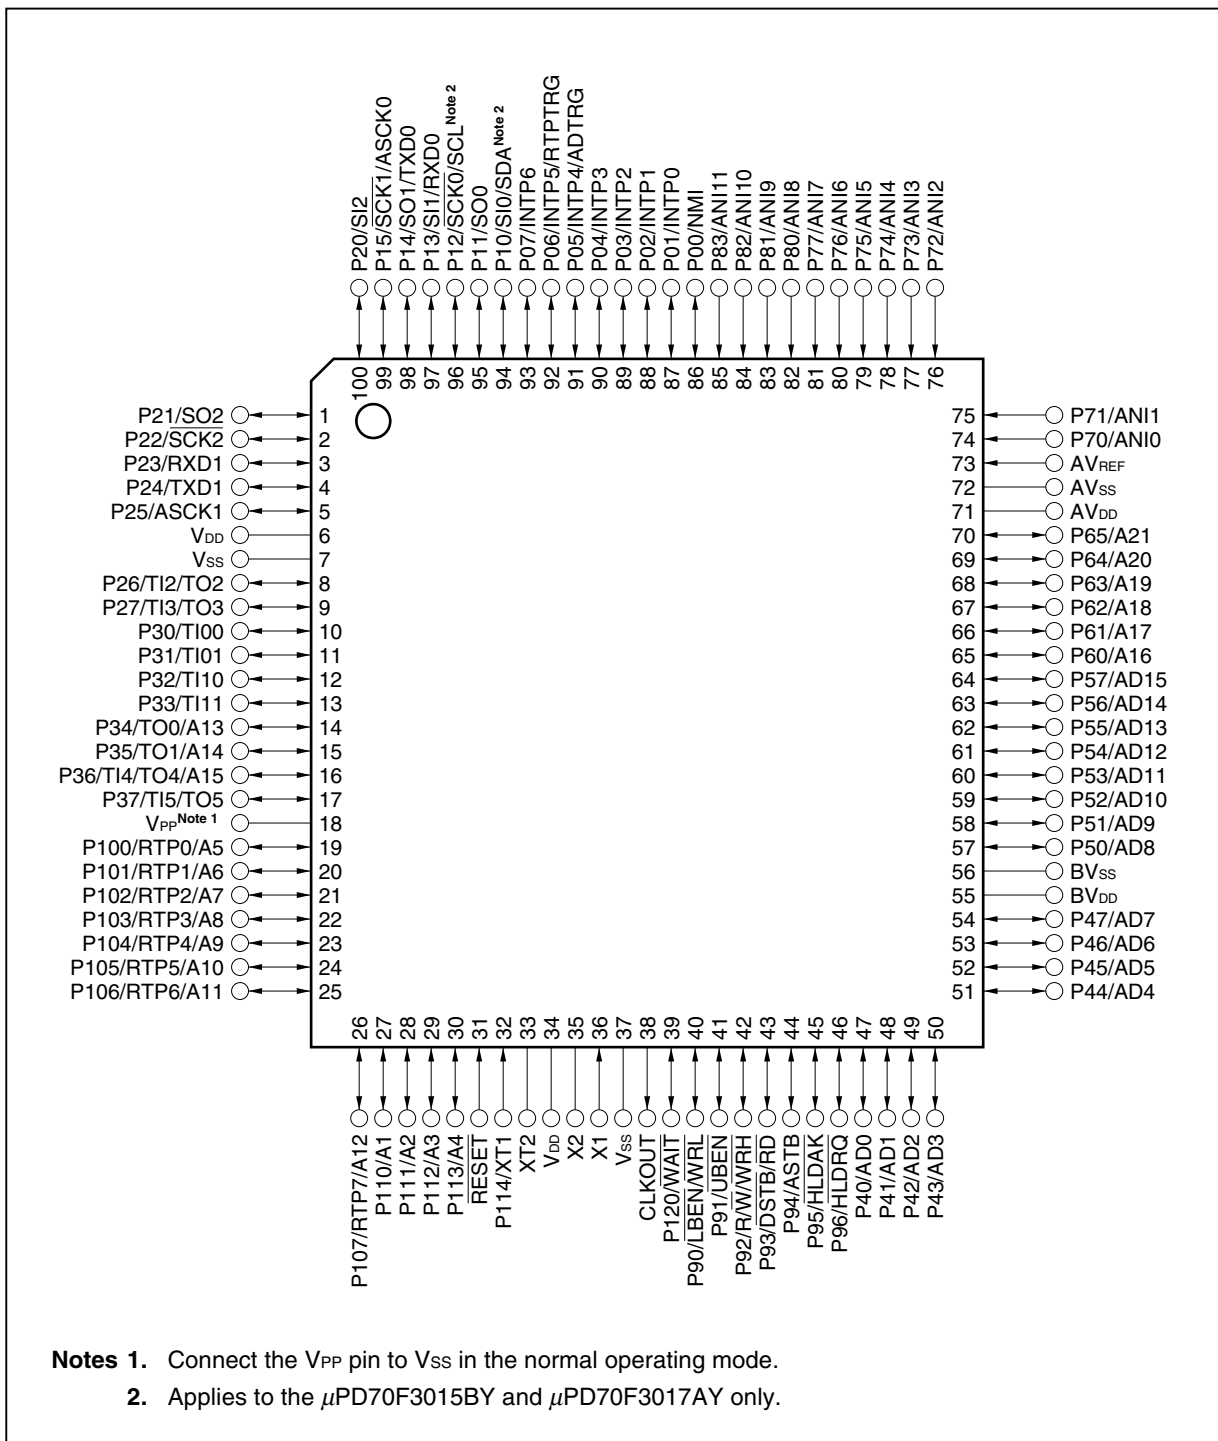

- Low-power portable devices
Cellular phones, PHSs, and camcorders

Note Connect the V_{PP} pin to V_{SS} in the normal operating mode.

Remarks 1. Alternate function names are omitted. The alternate functions are identical to the 100-pin plastic LQFP. However, the SCL and SDA pins are provided only in the μPD70F3017AY.

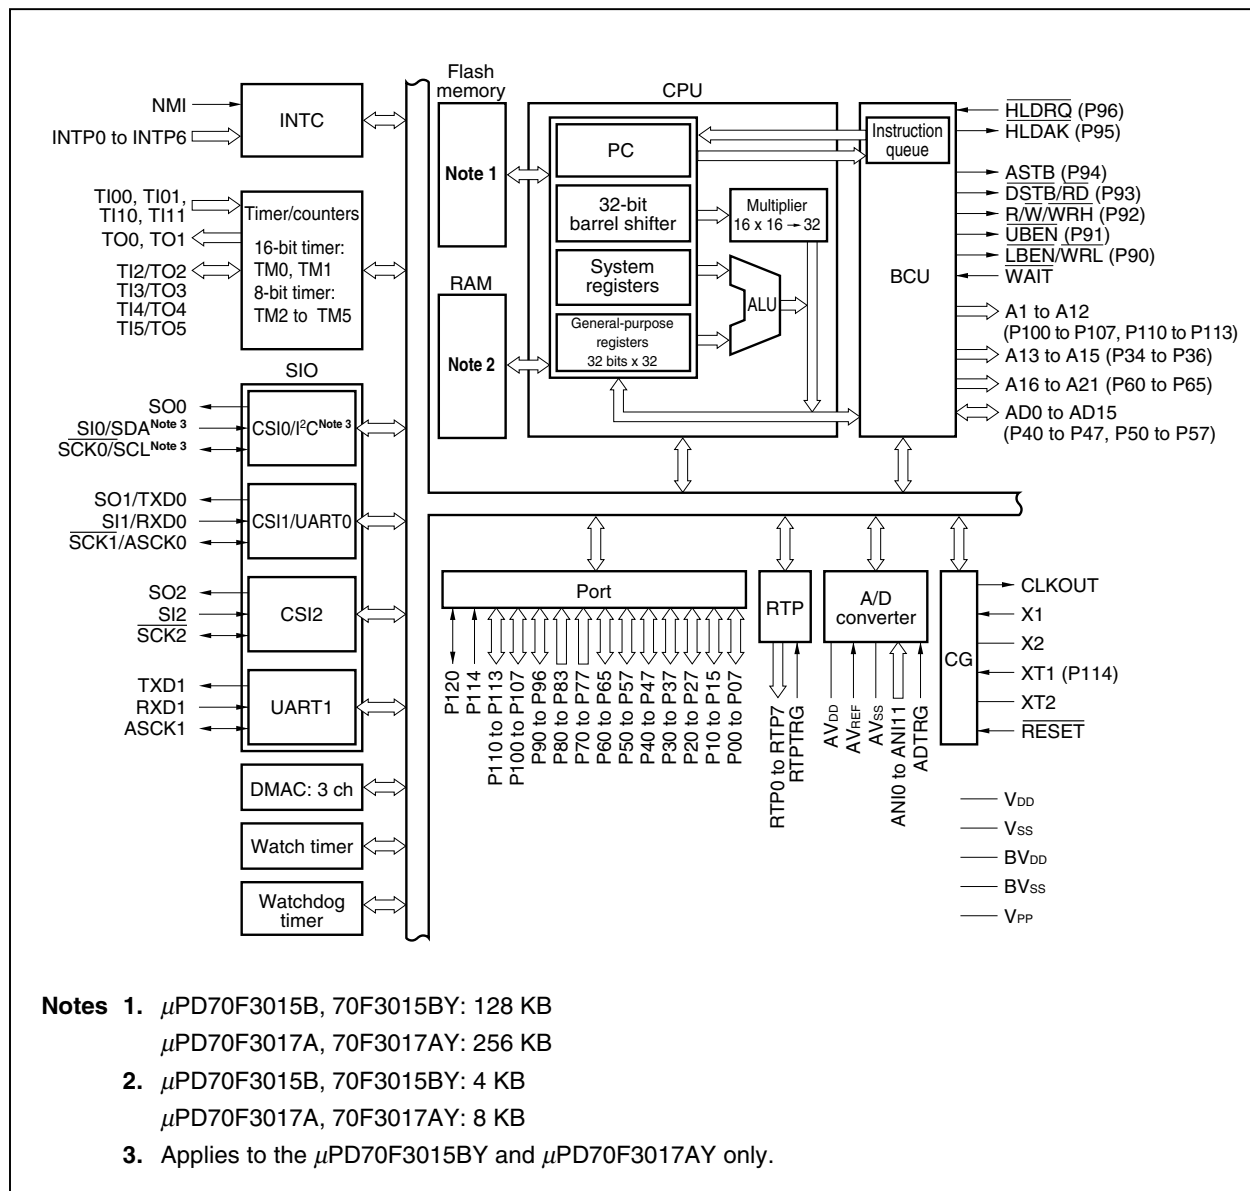

2. Connect the D4 pin directly to V_{SS}.

2. P40 to P47, P50 to P57, P60 to P65, P90 to P96, and their alternate-function pins.

3. P70 to P77, P80 to P83, and their alternate-function pins.

4. Be sure not to exceed the absolute maximum ratings (MAX. value) of each supply voltage.

- Cautions**
1. Do not directly connect the output (or I/O) pins of IC products to each other, or to V_{DD} , V_{CC} , and GND. Open-drain pins or open-connector pins, however, can be directly connected to each other. Direct connection of the output pins between an IC product and an external circuit is possible, if the output pins can be set to the high-impedance state and the output timing of the external circuit is designed to avoid output conflict.
 2. Product quality may suffer if the absolute maximum rating is exceeded even momentarily for any parameter. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions that ensure that the absolute maximum ratings are not exceeded.
The ratings and conditions indicated for DC characteristics and AC characteristics represent the quality assurance range during normal operation.

Operating Conditions

(1) Operating frequency, operating voltage

Internal Operation Clock Frequency (ϕ)	Supply Voltage (V_{DD})
$2\text{ MHz} \leq f_{xx} \leq 17\text{ MHz}$	2.7 to 3.6 V
$2\text{ MHz} \leq f_{xx} \leq 20\text{ MHz}$	3.0 to 3.6 V
$f_{XT} = 32.768\text{ kHz}$	2.7 to 3.6 V

★

(2) CPU Operating frequency

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit	
CPU operating frequency	f_{CPU}	Operation with main clock	$V_{DD} = 2.7\text{ to }3.6\text{ V}$	0.25		17	MHz
			$V_{DD} = 3.0\text{ to }3.6\text{ V}$	0.25		20	MHz
		Operation with subclock	$V_{DD} = 2.7\text{ to }3.6\text{ V}$		32.768		kHz

Recommended Oscillator

(1) Main clock oscillator (T_A = -40 to +85 °C)

(a) Connection of ceramic resonator or crystal resonator

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Oscillation frequency	f _{xx}	V _{DD} = 2.7 to 3.6 V	2		17	MHz
		V _{DD} = 3.0 to 3.6 V	2		20	MHz
Oscillation stabilization time		Upon reset release		2 ¹⁹ /f _{xx}		s
		Upon STOP mode release		Note		s

Note The TYP value differs depending on the setting of the oscillation stabilization time select register (OSTS).

Caution Ensure that the duty of oscillation waveform is between 45% and 55%.

- Remarks**
1. Connect the oscillator as close as possible to the X1 and X2 pins.
 2. Do not route the wiring near broken lines.
 3. For the resonator selection and oscillator constant, customers are required to either evaluate the oscillation themselves or apply to the resonator manufacturer for evaluation.

(b) External clock input

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Input frequency	f _{xx}	V _{DD} = 2.7 to 3.6 V	2		17	MHz
		V _{DD} = 3.0 to 3.6 V	2		20	MHz

- Cautions**
1. Connect the high-speed CMOS inverter as close as possible to the X1 pin.
 2. Sufficiently evaluate the matching between the μPD70F3015B, 70F3015BY, 70F3017A, 70F3017AY and the high-speed CMOS inverter.

(2) Subclock oscillator (T_A = -40 to +85 °C)

(a) Connection of crystal resonator

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Oscillation frequency	f _{XT}	V _{DD} = 2.7 to 3.6 V	32	32.768	35	kHz
Oscillation stabilization time				10		s

- Remarks**
1. Connect the oscillator as close as possible to the XT1 and XT2 pins.
 2. Do not route the wiring near broken lines.
 3. For the resonator selection and oscillator constant, customers are required to either evaluate the oscillation themselves or apply to the resonator manufacturer for evaluation.

(b) External clock input

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Input frequency	f _{XT}	V _{DD} = 2.7 to 3.6 V	32	32.768	35	kHz

- Cautions**

Note T_{sam} (count clock cycle) can be selected as follows by setting the PRMn2 to PRMn0 bits of prescaler mode register n, n1 (PRMn, PRMn1).

When n = 0 (TM0): $T_{sam} = 2T, 4T, 16T, 64T, 256T$ or 1/INTWTI cycle

When n = 1 (TM1): $T_{sam} = 2T, 4T, 16T, 32T, 128T,$ or 256T cycle

However, when the TIn0 valid edge is selected as the count clock, $T_{sam} = 2T$.

Capacitance load of each bus line		C _b		–	400	–	400	pF	

Notes 1. At the start condition, the first clock pulse is generated after the hold time.

2. The system requires a minimum of 300 ns hold time internally for the SDA signal in order to occupy the undefined area at the falling edge of SCL.

3. If the system does not extend the SCL signal low hold time (t_{LOW}), only the maximum data hold time (t_{HD:DAT}) needs to be satisfied.

4. The high-speed mode I²C bus can be used in the normal-mode I²C bus system. In this case, set the high-speed mode I²C bus so that it meets the following conditions.

- If the system does not extend the SCL signal's low state hold time:

$$t_{SU:DAT} \geq 250 \text{ ns}$$

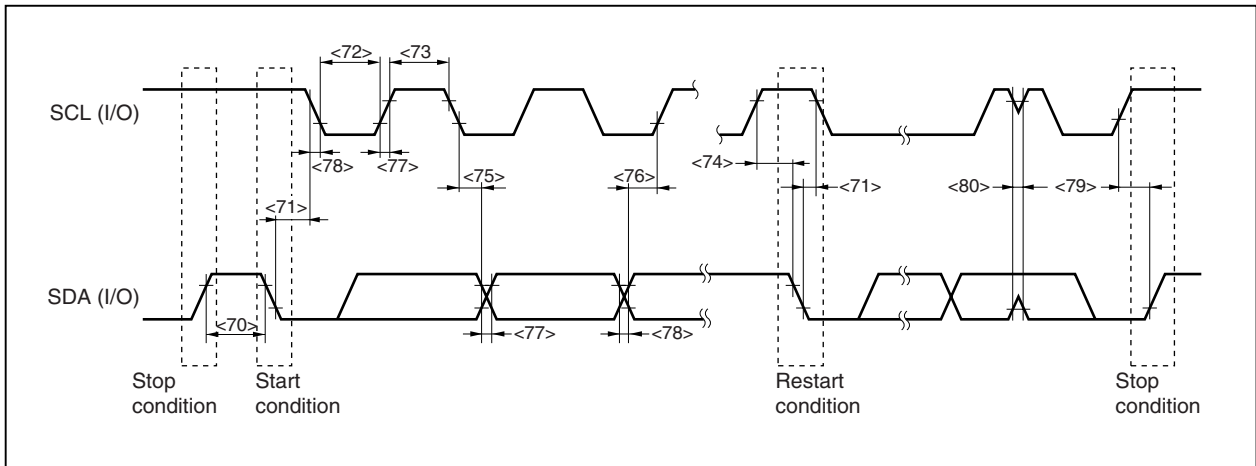

- If the system extends the SCL signal's low state hold time:

Transmit the following data bit to the SDA line prior to the SCL line release (t_{Rmax} + t_{SU:DAT} = 1,000 + 250 = 1,250 ns: Normal mode I²C bus specification).

5. C_b: Total capacitance of one bus line (unit: pF)

Remark The maximum operating frequency of the μPD70F3015BY and μPD70F3017AY is f_{xx} = 17 MHz.

Number of rewrites per area	C _{ERWR}	1 erase + 1 write after erase = 1 rewrite, Note 7	20			Count/area

- Notes**
1. The recommended setting value of the step erase time is 0.2 s.
 2. The prewrite time prior to erasure and the erase verify time (write-back time) are not included.
 3. The recommended setting value of the write-back time is 1 ms.
 4. Write-back is executed once by the issuance of the write-back command. Therefore, the retry count must be the maximum value minus the number of commands issued.
 5. The recommended setting value of the step writing time is 20 μs.
 6. 20 μs is added to the actual writing time per word. The internal verify time during and after the writing is not included.
 7. When writing initially to shipped products, it is counted as one rewrite for both “erase to write” and “write only”.

Example (P: Write, E: Erase)

Shipped product → P → E → P → E → P: 3 rewrites
 Shipped product → E → P → E → P → E → P: 3 rewrites

- Remarks**
1. When the PG-FP3 is used, a time parameter required for writing/erasing by downloading parameter files is automatically set. Do not change the settings unless otherwise specified.

4. RECOMMENDED SOLDERING CONDITIONS

The μPD70F3015B, 70F3015BY, 70F3017A, and 70F3017AY should be soldered and mounted under the following recommended conditions.

For the details of the recommended soldering conditions, refer to the document **Semiconductor Device Mounting Technology Manual (C10535E)**.

For soldering methods and conditions other than those recommended below, contact your sales representative.

NOTES FOR CMOS DEVICES

① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS

Note:

Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

② HANDLING OF UNUSED INPUT PINS FOR CMOS

Note:

No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Note:

Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

Caution The μ PD70F3015BY and μ PD70F3017AY contain an I²C bus interface circuit. Purchase of NEC I²C components conveys a license under the Philips I²C Patent Rights to use these components in an I²C system, provided that the system conforms to the I²C Standard Specification as defined by Philips.

Regional Information

Some information contained in this document may vary from country to country. Before using any NEC product in your application, please contact the NEC office in your country to obtain a list of authorized representatives and distributors. They will verify:

- Device availability
- Ordering information
- Product release schedule
- Availability of related technical literature
- Development environment specifications (for example, specifications for third-party tools and components, host computers, power plugs, AC supply voltages, and so forth)
- Network requirements

In addition, trademarks, registered trademarks, export restrictions, and other legal issues may also vary from country to country.

- No part of this document may be copied or reproduced in any form or by any means without prior written consent of NEC. NEC assumes no responsibility for any errors that may appear in this document.

- NEC does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from the use of NEC semiconductor products listed in this document or any other liability arising from the use of such products. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC or others.

- Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of customer's equipment shall be done under the full responsibility of customer. NEC assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.

- While NEC endeavours to enhance the quality, reliability and safety of NEC semiconductor products, customers agree and acknowledge that the possibility of defects thereof cannot be eliminated entirely. To minimize risks of damage to property or injury (including death) to persons arising from defects in NEC semiconductor products, customers must incorporate sufficient safety measures in their design, such as redundancy, fire-containment, and anti-failure features.

- NEC semiconductor products are classified into the following three quality grades: "Standard", "Special" and "Specific". The "Specific" quality grade applies only to semiconductor products developed based on a customer-designated "quality assurance program" for a specific application. The recommended applications of a semiconductor product depend on its quality grade, as indicated below. Customers must check the quality grade of each semiconductor product before using it in a particular application.

"Standard": Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots

"Special": Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)

"Specific": Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems and medical equipment for life support, etc.

The quality grade of NEC semiconductor products is "Standard" unless otherwise expressly specified in NEC's data sheets or data books, etc. If customers wish to use NEC semiconductor products in applications not intended by NEC, they must contact an NEC sales representative in advance to determine NEC's willingness to support a given application.

(Note)

(1) "NEC" as used in this statement means NEC Corporation and also includes its majority-owned subsidiaries.

(2) "NEC semiconductor products" means any semiconductor product developed or manufactured by or for NEC (as defined above).
