

Preliminary data

Bipolar IC

Type	Ordering code	Package
TDA 5510-2	Q67000-A8027	DIP 16

The TDA 5510-2 includes a controlled AM broadband amplifier equipped with a synchronous demodulator, a high gain controllable video IF amplifier and a VTR input/output. In addition, a generation circuit provides the control voltage for the IF amplifier and the PNP tuner.

Features

- Standard VTR connection
- Internal VTR switchover
- Gated control
- Positive and negative video output

Maximum ratings

Circuit description

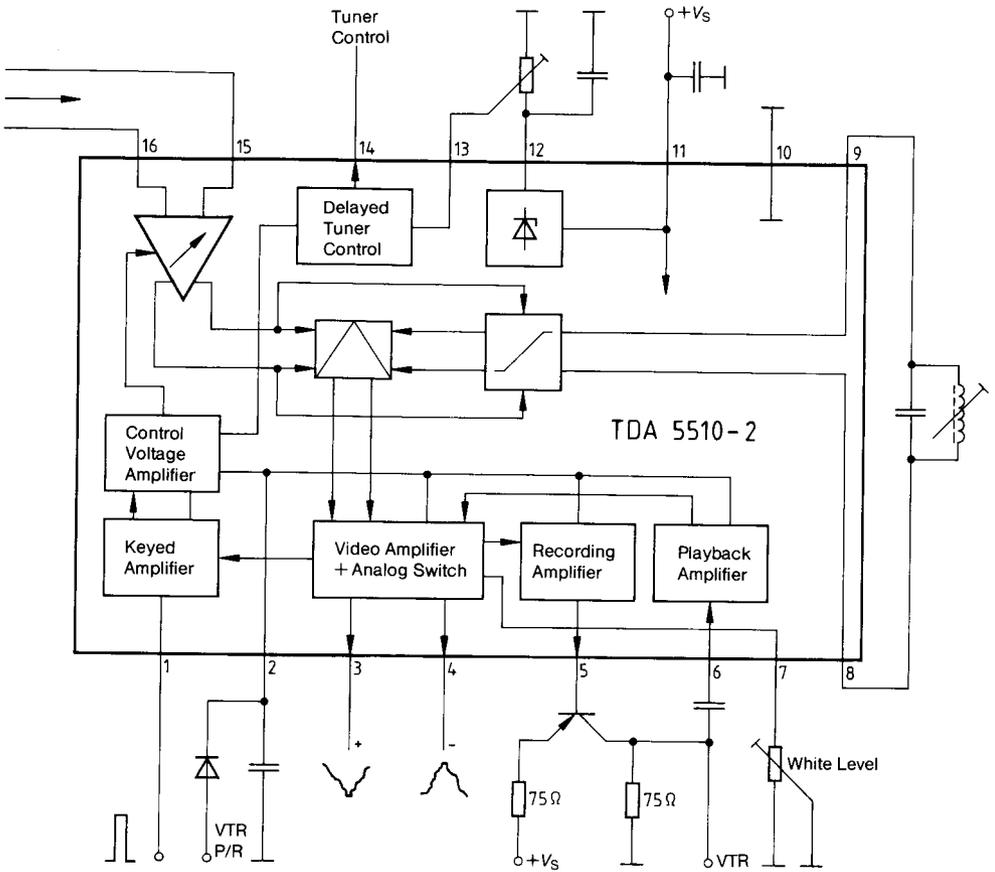

The integrated circuit is comprised of a 4-stage controllable AM amplifier, a limiter and mixer for synchronous demodulation of the video signals as well as an amplifier for both the positive and negative video output signal. The positive video signal as well as the positive flyback pulse are used for gated control. In addition, the component includes a standard VTR connection via an external transistor. The delayed tuner AGC is generated by a threshold amplifier driven by the control voltage.
