MAX6018

General Description

The MAX6018 is a precision, low-voltage, low-dropout, micropower voltage reference in a SOT23 package. This three-terminal reference operates with an input voltage from ($V_{OUT} + 200\text{mV}$) to 5.5V, and is available with output voltage options of 1.2V, 1.6V, 1.8V, and 2.048V

The MAX6018 voltage reference consumes less than 5 μA (max) of supply current and can source and sink up to 1mA of load current. Unlike conventional shunt-mode (two-terminal) references that waste supply current and require an external resistor, devices in the MAX6018 family offer a supply current that is virtually independent of supply voltage (with only 0.1 $\mu\text{A/V}$ variation with supply voltage) and do not require an external resistor. The MAX6018 has initial accuracies of 0.2% (A grade) and 0.4% (B grade) and temperature drift of 50ppm/ $^{\circ}\text{C}$ (max). The low-dropout voltage and the ultra-low, supply voltage-independent supply current make this device ideal for two-cell alkaline, end-of-life, battery-monitoring systems. The MAX6018 is available in a tiny 3-pin SOT23 package.

Applications

Two-Cell, Battery-Operated Systems
 Battery-Operated Equipment
 Hand-Held Equipment
 Data-Acquisition Systems
 Industrial and Process-Control Systems

Typical Application Circuit

Pin Configuration

Features

- ◆ Ultra-Low Supply Current: 5 μA (max)
- ◆ 1.6V Output from 1.8V Input
- ◆ Ultra-Small, 3-Pin SOT23 Package
- ◆ Initial Accuracy: $\pm 0.2\%$ (max)
- ◆ Low Temperature Drift: 50ppm/ $^{\circ}\text{C}$ (max)
- ◆ 200mV Dropout Voltage
- ◆ Load Regulation (1mA Source): 700 $\mu\text{V}/\text{mA}$ (max)
- ◆ Line Regulation ($V_{OUT} + 200\text{mV}$) to 5.5V: 250 $\mu\text{V}/\text{V}$ (max)
- ◆ Four Output Voltage Options: 1.2V, 1.6V, 1.8V, 2.048V

Note 1: Devices are 100% production tested at $T_A = +25^{\circ}C$ and are guaranteed by design from $T_A = T_{MIN}$ to T_{MAX} .

Note 2: Not production tested. Guaranteed by design.

Note 3: Dropout voltage is the minimum input voltage at which V_{OUT} changes $\leq 0.2\%$ from V_{OUT} at rated V_{IN} and is guaranteed by Load Regulation Test.

Note 4: Thermal hysteresis is defined as the change in $T_A = +25^{\circ}C$ output voltage before and after temperature cycling of the device (from $T_A = T_{MIN}$ to T_{MAX}). Initial measurement at $T_A = +25^{\circ}C$ is followed by temperature cycling the device to $T_A = +85^{\circ}C$ then to $T_A = -40^{\circ}C$ and another measurement at $T_A = +25^{\circ}C$ is compared to the original measurement at $T_A = +25^{\circ}C$.

Detailed Description

The MAX6018 is a precision, low-voltage, low-dropout, micropower, bandgap voltage reference in a SOT23 package. This three-terminal reference operates with an input voltage from ($V_{OUT} + 200\text{mV}$) to 5.5V, and is available with output voltage options of 1.2V, 1.6V, 1.8V, and 2.048V. These devices can source up to 1mA with $<200\text{mV}$ of dropout voltage, making them attractive for use in low-voltage applications.

Applications Information

Output/Load Capacitance

These devices require a minimum of 100pF load to maintain output stability.

They remain stable for capacitive loads as high as 1 μF . In applications where the load or the supply can experience step changes, a larger output capacitor reduces the amount of overshoot (or undershoot) and assists the circuit's transient response. Otherwise, applications may not need more than 100pF.

Supply Current

The 5 μA maximum supply current varies only 0.1 $\mu\text{A/V}$ with the supply voltage.

When the supply voltage is below the minimum-specified input voltage (as during turn-on), the devices can draw up to 20 μA beyond the nominal supply current. The input voltage source must be capable of providing this current to ensure reliable turn-on.

Pin Description

PIN	NAME	FUNCTION
1	IN	Supply Voltage Input. Bypass with a 0.1 μF capacitor to ground.
2	OUT	Reference Voltage Output. Bypass with at least 100pF to ground. (See <i>Output/Load Capacitance</i> section).
3	GND	Ground

Turn-On Time

These devices typically turn on and settle to within 0.1% of their final value in 200 μs . The turn-on time can increase up to 1ms with the device operating at the minimum dropout voltage and the maximum load.
