## ONE-CELL LI-ION BATTERY PROTECTION IC

### FEATURES

- Ideal for One-Cell Rechargeable Li-Ion Battery Packs
- High Accuracy Voltage Detection
- Low Current Consumption:
  - 3 $\mu$ A Supply Current (Typical)
  - 0.1 $\mu$ A Shutdown Current
- 3-Level Over Current Detection:
  - Over-Current Level 1 /Over Current Level 2 / Short Circuit
- Wide Operating Temperature Range:
  - 40°C to +85°C
- Small SOT26 Package

### GENERAL DESCRIPTION

The AAT8660 series are designed to protect one-cell rechargeable Li-Ion battery pack against over-charge, over-discharge, over-current and short circuit. They use CMOS process to provide high accuracy voltage detection and low current consumption.

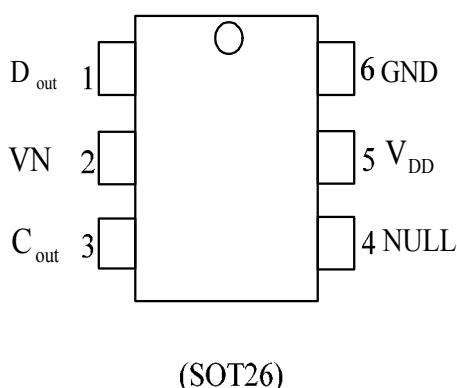

Each of the AAT8660 devices incorporates voltage comparators, bandgap reference voltage generator, signal delay circuit, short circuit detector, and digital control circuit.

In the charge process, when the battery voltage is charged to a value greater than  $V_{C1}$  (Over-Charge Threshold Voltage), the output of  $C_{out}$  pin switches to the low level, i.e., the  $V_N$  pin level. The output of  $C_{out}$  pin will switch to high level when the battery voltage falls lower than  $V_{C2}$  (Over-Charge Release Voltage), or when the charger is disconnected from the battery pack and the battery voltage level ranges between  $V_{C1}$  and  $V_{C2}$ .

During the discharge process, when the battery voltage drops to a value lower than  $V_{D1}$  (Over-Discharge Threshold Voltage), the output of  $D_{out}$  pin switches to low level immediately after the internal delay time elapses. The output of  $D_{out}$  pin will switch to high level when the battery voltage is at a level higher than  $V_{D2}$  (Over-Discharge Release Voltage).

Over current level 1 voltage ( $V_{OC1}$ ) is used to monitor the amount of discharge current. If the discharge current is high enough to cause VN pin voltage increase to a value greater than  $V_{OC1}$ , the output of  $D_{out}$  pin will switch to a low level after a delay time  $t_{OC1}$ . If the load is removed from battery pack, the output of  $D_{out}$  will change to a high level again.

The mechanism of short circuit protection is

identical to a discharge current. If the short circuit current is high enough to cause VN pin voltage increase to greater than  $V_{short}$ , the output of  $D_{out}$  pin will move to the low level after a delay time  $t_{short}$ , and the output of  $D_{out}$  level will change to high when the load is removed from battery pack.
