GENERAL DESCRIPTION

The 74HC/HCT195 are high-speed Si-gate CMOS devices and are pin compatible with low power Schottky TTL (LSTTL). They are specified in compliance with JEDEC standard no. 7A.

The 74HC/HCT195 performs serial, parallel, serial-to-parallel or parallel-to-serial data transfer at very high speeds. The "195" operates on two primary modes: shift right ($Q_0 \rightarrow Q_1$) and parallel load, which are controlled

by the state of the parallel load enable (\overline{PE}) input. Serial data enters the first flip-flop (Q_0) via the J and \bar{K} inputs when the \overline{PE} input is HIGH and shifted one bit in the direction $Q_0 \rightarrow Q_1 \rightarrow Q_2 \rightarrow Q_3$ following each LOW-to-HIGH clock transition. The J and \bar{K} inputs provide the flexibility of the JK type input for special applications and by tying the pins together, the simple D-type input for general applications. The "195" appears as four common clocked D flip-flops when the \overline{PE} input is LOW.

After the LOW-to-HIGH clock transition, data on the parallel inputs (D_0 to D_3) is transferred to the respective Q_0 to Q_3 outputs. Shift left operation ($Q_3 \rightarrow Q_2$) can be achieved by tying the Q_n outputs to the D_{n-1} inputs and holding the \overline{PE} input LOW.

All parallel and serial data transfers are synchronous, occurring after each LOW-to-HIGH clock transition. There is no restriction on the activity of the J, \bar{K} , D_n and \overline{PE} inputs for logic operation other than the set-up and hold time requirements. A LOW on the asynchronous master reset (\overline{MR}) input sets all Q outputs LOW, independent of any other input condition.

QUICK REFERENCE DATA

GND = 0 V; T_{amb} = 25 °C; t_r = t_f = 6 ns

SYMBOL	PARAMETER	CONDITIONS	TYPICAL		UNIT
			HC	HCT	
t _{PHL} / t _{PLH}	propagation delay CP to Q _n	C _L = 15 pF; V _{CC} = 5 V	15	15	ns
f _{max}	maximum clock frequency		57	57	MHz
C _I	input capacitance		3.5	3.5	pF
C _{PD}	power dissipation capacitance per package	notes 1 and 2	105	105	pF

Notes

1. C_{PD} is used to determine the dynamic power dissipation (P_D in μW):

$$P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum (C_L \times V_{CC}^2 \times f_o) \quad \text{where:}$$

f_i = input frequency in MHz

f_o = output frequency in MHz

$\sum (C_L \times V_{CC}^2 \times f_o)$ = sum of outputs

C_L = output load capacitance in pF

V_{CC} = supply voltage in V

2. For HC the condition is V_I = GND to V_{CC}
For HCT the condition is V_I = GND to V_{CC} - 1,5 V
