

TC74HC377AP, TC74HC377AF, TC74HC377AFW**OCTAL D - TYPE FLIP - FLOP**

The TC74HC377A is a high speed CMOS OCTAL D - TYPE FLIP - FLOP fabricated with silicon gate C²MOS technology. It achieves the high speed operation similar to equivalent LSTTL while maintaining the CMOS low power dissipation. This 8-bit D - type flip - flop is controlled by a clock input (CK) and an output enable input (\bar{G}).

The signal level applied to the D inputs are transferred to Q outputs during the positive going transition of CK.

When the \bar{G} is high, the eight outputs are in a high impedance state.

All inputs are equipped with protection circuits against static discharge or transient excess voltage.

Note (1) C_{PD} is defined as the value of the internal equivalent capacitance which is calculated from the operating current consumption without load.

Average operating current can be obtained by the equation :

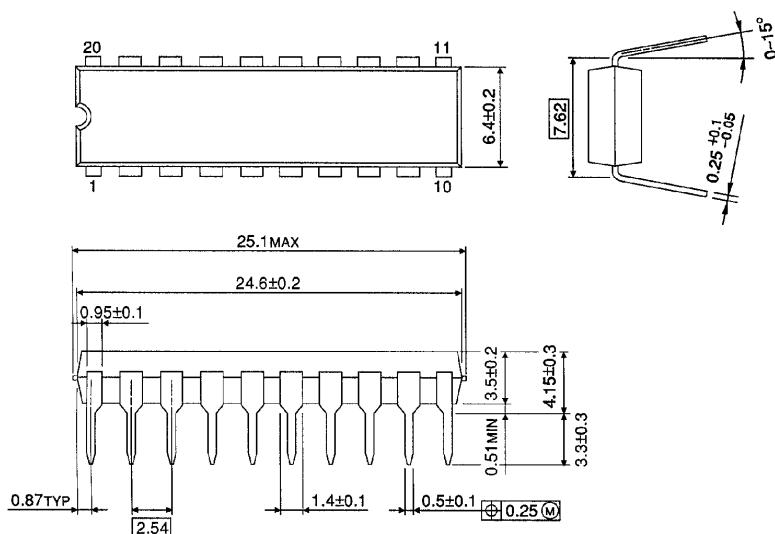

$$I_{CC}(\text{opr}) = C_{PD} \cdot V_{CC} \cdot f_{IN} + I_{CC}/8 \text{ (per Flip Flop)}$$

And the total C_{PD} when n pcs. of Flip Flop operate can be gained by the following equation :

$$C_{PD}(\text{total}) = 22 + 10 \cdot n$$
