

### Features/Applications

- CVSD Encode + Decode
- Programmable Clock Rates
- Programmable Voice Filters
- Voice Power Output
- Voice Spectrum Monitor
- 8-bit Memory/Instruction I/O
- Processor Interface
- Voice Message Mailbox
- Status Annunciators
- Re-try Message Forward
- Voice Security Scrambling
- Voice Data Communications
- Time/Frequency Companding
- Audio Delay Functions

Fig. 1 System Schematic Diagram

# FX709

### Brief Description

The FX709 is an audio-digital interface codec for microprocessor controlled Voice Store and Retrieve applications.

In encode, audio input signals are band-limited by a lowpass filter and digitised by a CVSD 1-bit serial encoder. After conversion to 8-bit parallel format, encoded data is read to the I/O bus for storage in memory.

In decode, memory contents written into the I/O port are converted back to 1-bit serial form and decoded by a CVSD decoder. The decoder output is lowpass filtered and output as retrieved audio.

The audio encode/decode functions are independently controlled, permitting concurrent or asynchronous VSR operations

to be performed. Time and frequency companding is available via independently programmable encode/decode data rates and filter cut-offs.

Support for VOX functions and 'Pause' memory management is provided by the power assessment register.

This contains two 4-bit numbers representing the average signal levels into the data encoder and a replica encoder over a programmable averaging period.

The device instruction set includes input/output signal switching and a standby powerdown function. The FX709 is a lowpower CMOS circuit and uses a single 5 volt supply.

## Pin Number

## Function

FX709J/LH

1

**Xtal:** Output of clock oscillator inverter.

2

**A<sub>0</sub>:**

3

**A<sub>1</sub>:** These pins determine which register may be addressed via the I/O port.

4

**R/W:**

A <sub>0</sub>	A <sub>1</sub>	R/W	Register
0	0	0	'A' instruction
1	0	0	'B' instruction
0	1	0	Decoder
1	1	0	No Register
0	0	1	Status
1	0	1	Power
0	1	1	Encoder
1	1	1	No Register

5

**CS:** Chip Select input, this input has a 1 MΩ pullup to V<sub>DD</sub>.

6

**D<sub>0</sub>:**

7

**D<sub>1</sub>:**

8

**D<sub>2</sub>:**

9

**D<sub>3</sub>:**

10

**D<sub>4</sub>:**

11

**D<sub>5</sub>:**

12

**D<sub>6</sub>:**

13

**D<sub>7</sub>:**

I/O Port

14

**IRQ:** Interrupt Request Output, this pin is the output of the interrupt request generator. This device can be "wire OR'd" with other active-low components. See section on Interrupt Requests. (100kΩ internal pullup to V<sub>DD</sub>).

15

**WAIT Output:** The circuit requires a minimum Chip Select time of t<sub>ACS</sub>. If the host μP has a CS time of less than this the WAIT output must be used to delay the μP when accessing the FX709. (See Figure 7). (100kΩ internal pullup to V<sub>DD</sub>).

**NOTE:** If the WAIT output is to be used, then to prevent spurious operation of this function during Power-Up, it is recommended that:

- a: Power-Up of the FX709 is delayed until μP Power-Up is complete, or,
- b: The Chip Select input is held open-circuit during the FX709 Power-Up sequence.

16

No connection.

17

**Analogue Output B:** (See Figure 4).

18

**Analogue Output A:** (See Figure 4).

19

**V<sub>BIAS</sub>:** The bias or analogue ground pin and is internally set to V<sub>DD</sub>/2. It should be decoupled to V<sub>SS</sub> with a capacitor of 1.0μF (min.).

20

**Analogue Input A:** (See Figure 2, Note 4 and Figure 4).

21

**V<sub>DD</sub>:** Positive Supply.

22

**Analogue Input B:** (See Figure 2, Note 4 and Figure 4).

23

No connection.

24

**Analogue Input C:** This is the analogue input to the power encoder.

25

**Analogue Output A/B:** (See Figure 4).

26

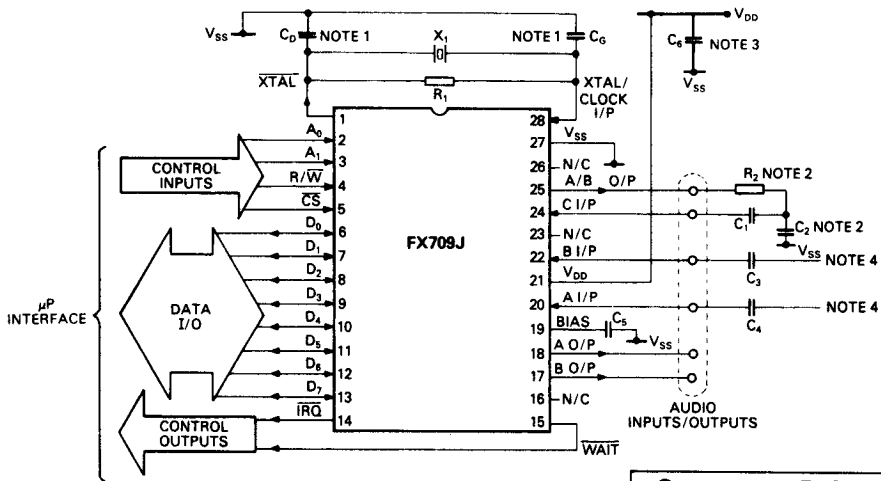

No connection.

27

**V<sub>SS</sub>:** Negative supply.

28

**Xtal/Clock Input:** This is the input to the clock oscillator inverter. A 1.0 MHz Xtal input or externally derived clock is injected at this pin.

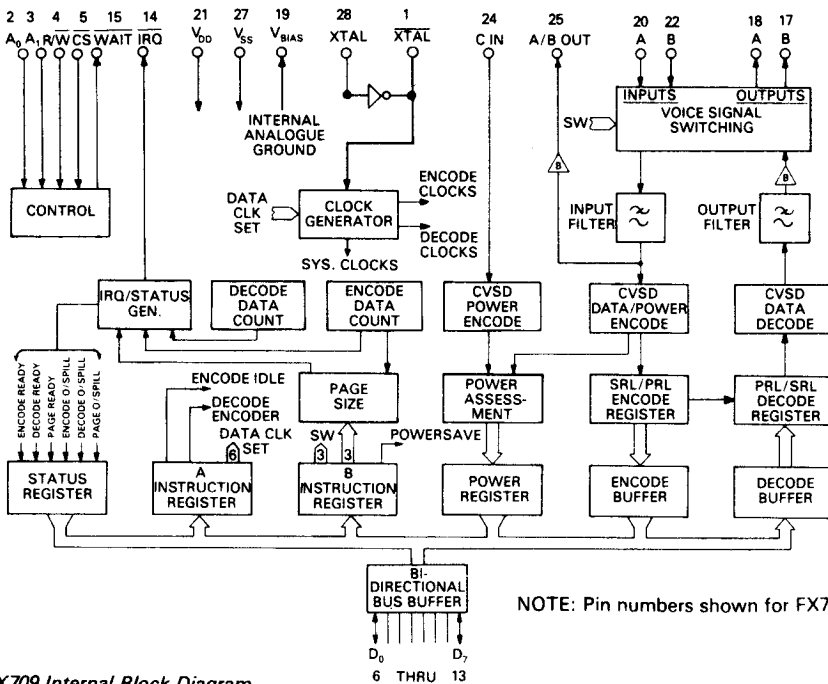

**NOTES:**

1.  $C_0$  used to reduce voltage overshoot. Refer to CML Crystal application Applications Note D/XT/1 April 86.
2.  $R_2, C_2$  forms a lowpass filter input to 'C' input power assessment circuit. The values shown represent a 820Hz lowpass although other cutoff frequencies may be selected depending on the application — see page 9.
3. Additional decoupling may be necessary for noisy supplies.
4. To prevent unwanted internal oscillations at the Encoder input pins, the source impedance to these inputs must be less than  $1000\Omega$ . Output idle channel noise levels will improve with even lower source impedances.

Fig. 3 FX709 Internal Block Diagram

# Analogue Switching

The input and output switching of analogue signals is controlled by the state of bit no's  $D_3$ ,  $D_4$  and  $D_5$  in Instruction Register B.

Fig. 4 Audio Switching – Simplified Block Schematic

## Frequency and Data Rate Control

Six bits of Instruction Register A ( $D_2 - D_7$ ) control the data rates of the encoder and decoder and the bandwidths of the filters for the encoder and decoder. The configuration of the frequency dividers is as shown in the diagrams below and obtainable combinations of frequencies with various input clocks are listed.

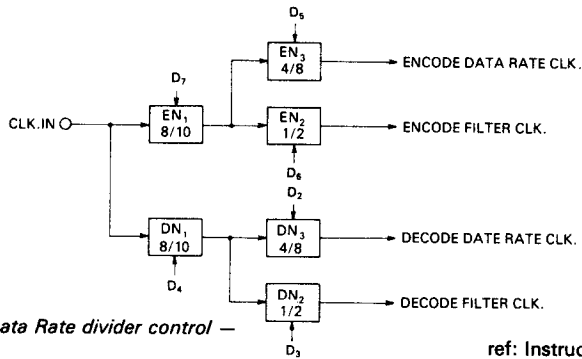

Fig. 5 Filter Clock and Data Rate divider control – Block diagram

\* Caution: Although possible, the Codec insertion loss is not according to the specification at these settings. (see Page 10).

Table 1 Possible combinations of clock input frequency, filter cutoff (Hz) and Data Clock (kbs)

## Register Truth Tables

The following tables describe the function of each bit within each register. 'Address Input' logic states are shown in the top right hand corner of each table. The following registers are described below:

Instruction Register 'A'	[IRA]	pages 5 and 6
Instruction Register 'B'	[IRB]	pages 6 and 7
Status Register	[SR]	pages 8 and 9
Power Register	[PR]	page 9

IRA	INSTRUCTION REGISTER 'A'			$A_0 = 0$ $A_1 = 0$ $R/W = 0$
Bit	Function Name	Logic State	References	NOTES
D <sub>0</sub>	Encoder Idle	 1  0	SRD <sub>3</sub>	D <sub>0</sub> sets the encoder idle/normal mode of operation.  <b>FORCED:</b> Forces the encode register to fill with a 1010101... idle pattern. <i>Note: incoming encoded data is still available for the power assessment circuits.</i>  <b>NORMAL:</b> Allows the encode register to fill with encoded data. Data is transferred to the encode buffer during the last bit of the encode byte.
D <sub>1</sub>	Decoder Data Source In Overspill	 1  0	SRD <sub>4</sub>	D <sub>1</sub> determines the source of data for the decoder.  <b>ENCODER:</b> Internally connects the output of the encode register to the input of the decode register. This condition effectively connects the audio straight through. The encoded data may still be accessed via the encode buffer, and I/O port.  Fills the decode register with idle pattern. In either case data may be loaded into the decode register via the I/O port. This automatically overwrites the current contents of the decode register.

(see fig. 9).</p>	
D <sub>4</sub> D <sub>5</sub> D <sub>6</sub> D <sub>7</sub>	"C" Power LSB  "C" Power MSB		<p>D<sub>4</sub>—D<sub>7</sub> represent the average signal level of the last page of data in the range from +6dBm to -24dBm (at 1kHz) for the C input.</p>	

## Interrupts

Three conditions can cause interrupt requests to the host microprocessor.

- (i) The encode buffer contains an unread byte of data which is the most recent byte encoded.
- (ii) The decode buffer is ready to receive the next consecutive byte for decoding.
- (iii) The power register contains a power assessment for the most recent whole page encoded.

The status register indicates which of the above conditions are true.

If an interrupt condition remains unserved and the condition becomes irrecoverably untrue, the status bit is cleared, the corresponding overspill bit is set and further interrupts are automatically inhibited. Also the encode and decode data buffers retain the data present when the data bit was set, i.e. register-buffer update is inhibited. The power register is updated at all times.

Condition (i) is serviced by a valid address to the encode buffer. Condition (ii) is serviced by a valid address to the decode buffer. If conditions (i) and (ii) have both become UNTRUE, servicing either buffer resets both to a cleared start position. Condition (iii) is serviced by reading the Power Register.

## The C Input

By careful selection of the audio frequency filtering to the C input the A/B and C power words can be used in the processor to provide frequency as well as power information. This facility could be used for word, pause or voice recognition.

# Specification

## Absolute Maximum Ratings

Exceeding the maximum rating can result in device damage. Operation of the device outside the operating limits is not implied.

Supply voltage	-0.3V to 7.0V
Input voltage at any pin (ref. $V_{SS} = 0V$ )	-0.3V to ( $V_{DD} + 0.3V$ )
Output sink/source current (total)	20mA
Operating temperature range: FX709J	-30°C to + 85°C
FX709LH	-30°C to + 70°C
Storage temperature range: FX709J	-55°C to + 125°C
FX709LH	-40°C to + 85°C

## Operating Limits

All characteristics measured using the following parameters unless otherwise specified:

$V_{DD} = 5V$ ,  $T_{amb} = 25^{\circ}C$ ,  $\emptyset = f_{in} = 1kHz$ .

Characteristics	See Note	Min	Typ	Max	Unit
-----------------	----------	-----	-----	-----	------

### Static Characteristics

Supply voltage		4.5	5.0	5.5	V
Supply Current		—	6	—	mA
Supply Current (Power Save)		—	1	—	mA

## Package Outlines

The FX709 is available in the package styles outlined below. Mechanical package diagrams and specifications are detailed in Section 10 of this document. Pin 1 identification marking is shown on the relevant diagram and pins on all package styles number anti-clockwise when viewed from the top.

## Handling Precautions

The FX709 is a CMOS LSI circuit which includes input protection. However precautions should be taken to prevent static discharges which may cause damage.
