Turn key Pentium Pro[1] power supply specification

The new IRP6VRM1 offers the power supply designer a complete turn-key solution for dc/dc convertors required to power next-generation microprocessors. A synchronous buck regulator topology operating at 200kHz is employed and achieves excellent efficiency with very fast load response and tight output voltage regulation.

The new Super FETKY™ is used in the synchronous recirculation circuitry to reduce board space and assembly costs while actually improving circuit efficiency through reduced stray inductance. Complete performance characterization along with detailed schematic, bill-of-materials, PCB layout and modelling are offered to reduce the customer's design time and effort.

Purpose

This is a production ready design. It has been thoroughly tested for performance against the Intel P6 power specification, and evaluated for manufacturability by a high volume manufacturer.

This design will not be manufactured by International Rectifier. Its purpose is to simplify the design and qualification process for our customers.

Web Site

This design may be downloaded in two formats at IR's web site (http://www.irf.com). One is PDF format for on screen viewing or printing, the other is in native format.

Floppy Disk

The design is also available on floppy disk. As on our web site, the floppy version contains two formats, PDF and native format.

Demo Boards

Completed boards are available free to IR customers, and at a reasonable charge to others.

Support

E-Mail Chris Davis at cdavis1@irf.com for support of this design.

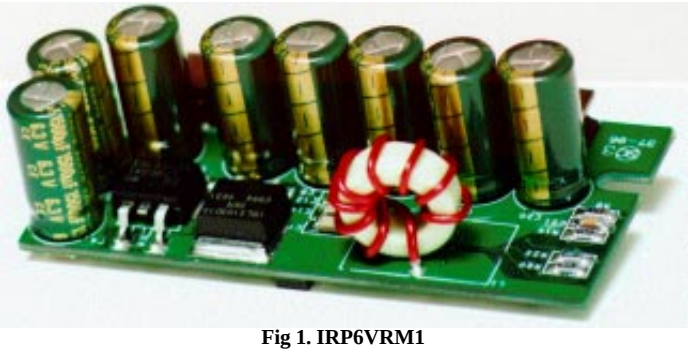

Fig 1. IRP6VRM1

Key Features

- conforms to Intel 200Mhz P6 specification
- 12.4 ampere continuous output
- 2.0V-to-3.5V digitally selectable output
- 30A/µS transient load response capability
- greater than 90% efficient
- short circuit protected
- **Super FETKY™** synchronous rectifier

Contents

Copy Right Restriction

This design may be used for production or evaluation purposes under the condition that all IR labeling and identification marks remain on all boards produced using this design, or as otherwise agreed to in writing by International Rectifier.

Specifications

Absolute maximum ratings (Table 1)

Parameter	Min	Max	Units	Conditions / Description
5 volt input	-	6.0	V	
12 volt input	-	15.0	V	
Continuous output current	-	12.4	A	Pulse width > 100ms
Pulsed output current	-	14	A	100ms pulse width, 1% duty factor
Ambient Temperature	10	60	ºC	

Electrical Input Specifications

Parameter	Min	Typ	Max	Units	Conditions / Description
5 volt input (5Vin)	4.75	5.0	5.25	V	Supply meet all output specifications
5 volt input current	-	-	10	A	All line and load conditions
12 volt input (12Vin)	11.8	12.0	13.2	V	Supply meets all output specifications
12 volt input current	-	12.5	50	mA	All line and load conditions

Power Output Specifications (all specified line and load conditions)

Parameter	Min	Typ	Max	Units	Conditions / Description
Voltage Range	2.0	-	3.5	V	Selected by VID[0:3]
Current	0	-	12.4	A	
Voltage regulation	-5	-	+5	%	Of nominal VID set point. Includes 30A/us transients from min-to-max-to-min load current
Ripple voltage	-1	-	+1	%	Percent of set point.
Turn on settling time	-	1.5	10	mS	Within ±10% of VID set point

Digital Input / Output Specifications

Signal	Input / Output	Conditions / Description
PWRGD	output	Open collector output. Logic 1 output signifies that the voltage output of the module is within ±10% of the selected level
OUTEN	input	Open collector input. Logic 0 disables the module output.
UP#	input	Open. Not required in this module since the module has upgrade capability.
VID[0:3]	input	Open collector input. Selects nominal output voltage as shown in table #2.

Output Fault Protection

Parameter	Min	Typ	Max	Units	Conditions / Description
Short circuit protection	13	17	21	A	Limits output current during short circuit or overload
Over voltage protection	+10	-	+20	%	Shuts down the power supply when the output voltage exceeds 10%-to-20% above the set point

Assembly Options

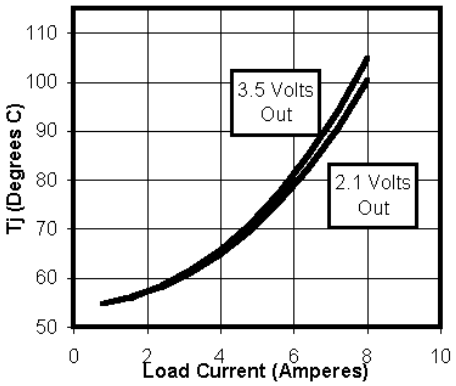
Options For 8A Output (table #4)

REF	From	To
C4	1500UF	Don't install
C6, C8	1500UF	Don't install
Q1	IRL3103S	IRL3303S
Q2	IRL3103D1S	IRL3303S
L1	IR001	IR002

8 Ampere Design Adaptation

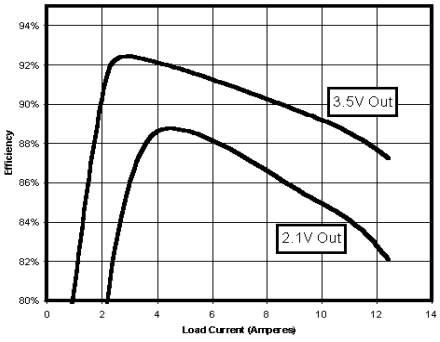
Many mother boards do not require the full 12.4 ampere current output. In this case the IRP6VRM1 can be adapted to lower current levels by using the assembly options shown. These options will reduce cost by removing components and by using smaller die size MOSFET's. Substitution of a MOSFET for a FETKY will reduce efficiency somewhat, but junction temperatures will still remain well within a safe limit.

Fig 8. Typical T_j of Q1 @ T_a = 50ºC, still air



Static Performance

Fig 9. Average Efficiency



Efficiency

Efficiency is required to be at least 80% at full load. Thanks to the very efficient IRL3103S and the **Super FETKY** IRL3103D1S, IRP6VRM1 exceeds the required specification by a wide margin.

Maximum Junction Temperature

Analysis of Q1 junction temperature shows that it remains within specifications at an ambient temperature of 50 degrees C, even in still air.

Fig 10. Typical T_j of Q1 @ T_a = 50ºC, still air

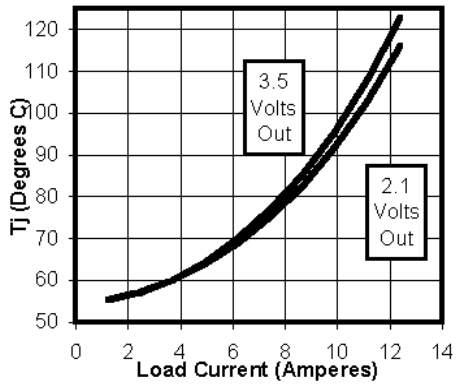


Fig 11. Load Regulation, 2.1 Volts Out

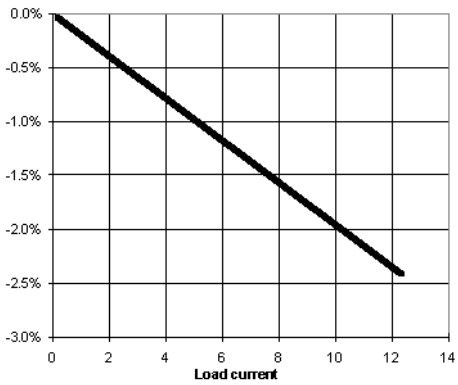
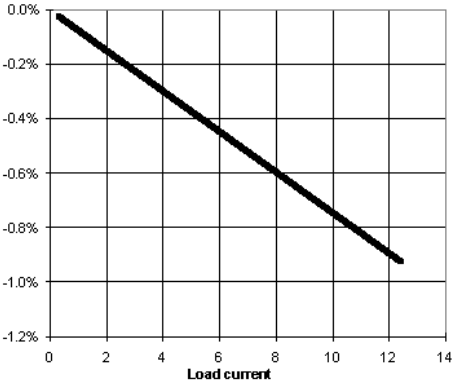


Load Regulation

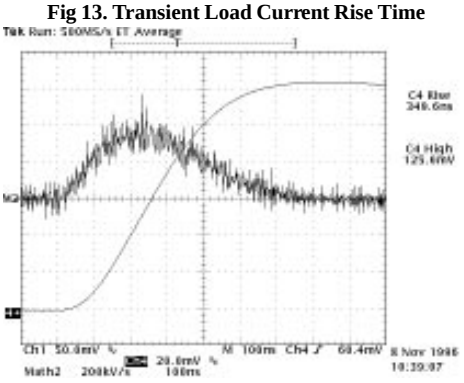
The output must stay within it's +5% specification from no load to full load.

Fig 12. Load Regulation, 3.5 Volts Out



Dynamic Performance

Fig 13. Transient Load Current Rise Time



Transient Load Test Conditions

The Intel specification requires the supply to stay within its ±5% specification during transient load event of 0.3A-to-12.4A in 413ns. Although most mother boards do not require this full level of performance, the IRP6VRM1 meets the full transient response specification.

Fig 14. Transient Load Current Fall time

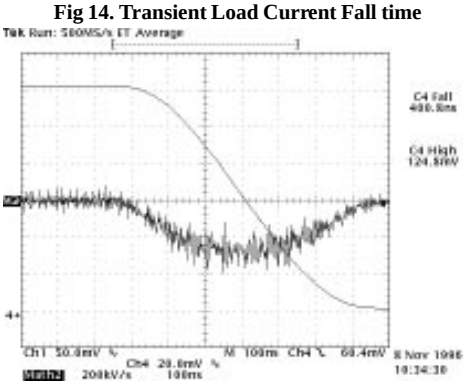


Fig 15. 100 Hz 3.5 Volts Output

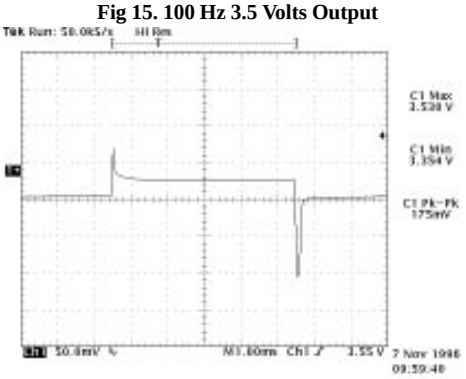

Transient Load At 3.5V Out

Performance at 100kHz is dominated by stray output inductance. This inductance is a combination of output capacitor ESL and board / connector inductance.

Performance at 100Hz is dominated by loop characteristics.

	Limit	100Hz	100kHz
Min	3.325	3.354	3.351
Max	3.675	3.530	3.519

Fig 16. 100 kHz 3.5 Volts Output

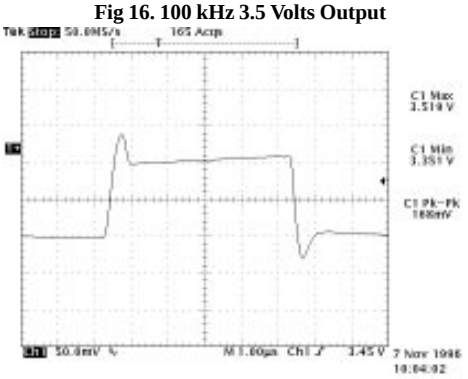

Fig 17. 100Hz 2.1 Volts Output

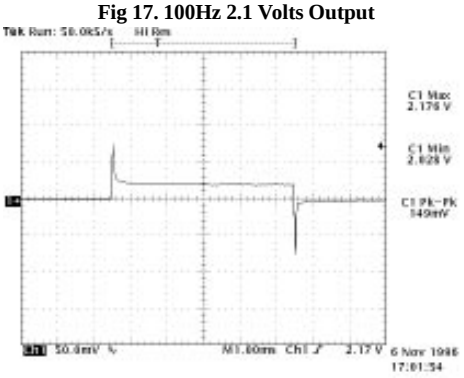

Transient Load At 2.1V Out

Performance at 2.1 volts out is very similar to that at 3.5 volts. The notable exception is a reduction of the negative spike at the current rising edge. This is due to having more average voltage available to change the current in L1.

	Limit	100Hz	100kHz
Min	1.995	2.028	2.004
Max	2.205	2.176	2.163

Fig 18. 100kHz 2.1 Volts Output

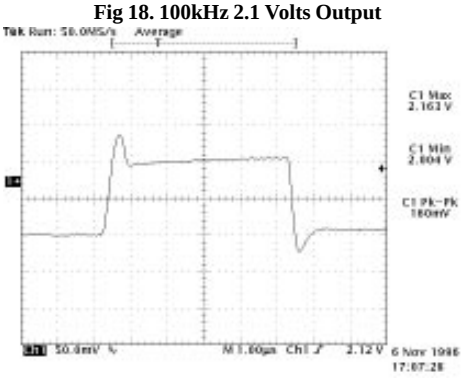

Fig 19. Turn On Input Current Waveform

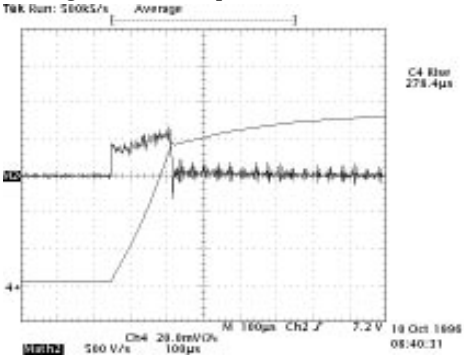
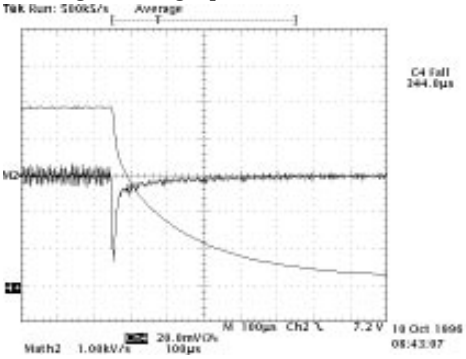


Input di/dt During Transient Load

The Intel guideline (optional) specification calls for a maximum input di/dt during transient load of 0.1A/us. The IRP6VRM1 readily meets this specification at turn on, but falls short at turn off.

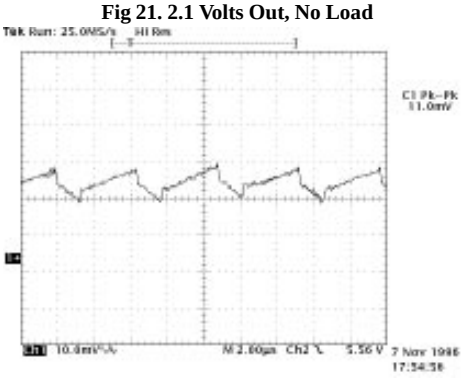
This is common to all VRM boards evaluated by IR, regardless of manufacturer. It should not cause difficulties for most users, but if it is an issue for your design, add input inductance.

Fig 20. Falling Input Current Waveform



Dynamic Performance (continued)

Fig 21. 2.1 Volts Out, No Load



Output Ripple Voltage

Output ripple voltage is specified as a maximum 2% p-p.

Out	Limit	Measured
2.1V	42mV	11mV
3.5V	70mV	16mV

Fig 22. 3.5 Volts Out, Full Load

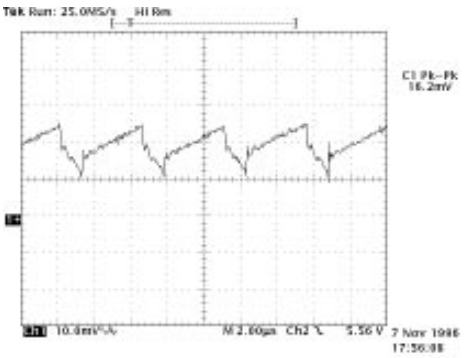


Fig 23. Turn on Waveform, 2.1 Volts Out

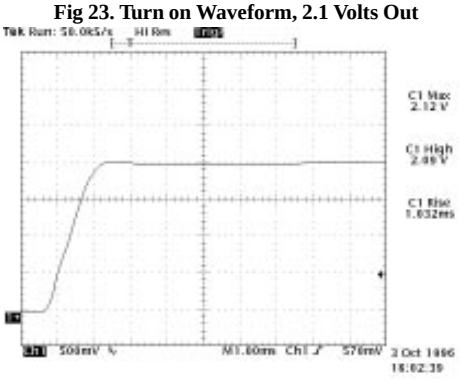

Turn On Transient

Output voltage must remain within 10% of the nominal set point.

Out	Limit	Measured
2.1V	2.31	2.12
3.5V	3.85	3.84

Fig 24. Turn on Waveform, 3.5 Volts Out
