

## MICROPOWER, ULTRA-SENSITIVE HALL-EFFECT SWITCH

### Package Suffix 'LH' Pinning (SOT23W)

Dwg. PH-016-1

Pinning is shown viewed from branded side.

### ABSOLUTE MAXIMUM RATINGS at $T_A = +25^\circ\text{C}$

Supply Voltage, $V_{DD}$ .....	5 V
Magnetic Flux Density, B .....	Unlimited
Output Off Voltage, $V_{OUT}$ .....	5 V
Output Current, $I_{OUT}$ .....	1 mA
Junction Temperature, $T_J$ .....	+170°C
Operating Temperature Range, $T_A$	
Suffix 'E-' .....	-40°C to +85°C
Suffix 'L-' .....	-40°C to +150°C
Storage Temperature Range,	
$T_S$ .....	-65°C to +170°C

*Caution: These CMOS devices have input static protection (Class 3) but are still susceptible to damage if exposed to extremely high static electrical charges.*

The A3212 integrated circuit is an ultra-sensitive, pole independent Hall-effect switch with a latched digital output. This sensor is especially suited for operation in battery-operated, hand-held equipment such as cellular and cordless telephones, pagers, and palmtop computers. A 2.5 volt to 3.5 volt operation and a unique clocking scheme reduce the average operating power requirements to less than 15  $\mu\text{W}$  with a 2.75 volt supply.

Unlike other Hall-effect switches, either a north or south pole of sufficient strength will turn the output on; in the absence of a magnetic field, the output is off. The polarity independence and minimal power requirement allow these devices to easily replace reed switches for superior reliability and ease of manufacturing, while eliminating the requirement for signal conditioning.

Improved stability is made possible through chopper stabilization (dynamic offset cancellation), which reduces the residual offset voltage normally caused by device overmolding, temperature dependencies, and thermal stress.

This device includes on a single silicon chip a Hall-voltage generator, small-signal amplifier, chopper stabilization, a latch, and a MOSFET output. Advanced BiCMOS processing is used to take advantage of low-voltage and low-power requirements, component matching, very low input-offset errors, and small component geometries.

Three package styles provide a magnetically optimized package for most applications. Package suffixes 'EH' and 'LH' are for miniature low-profile (leadless and leaded, respectively) surface-mount packages while suffix 'UA' is for a three-lead SIP for through-hole mounting.

### FEATURES

- Micropower Operation
- Operation with North or South Pole
- 2.5 V to 3.5 V Battery Operation
- Chopper Stabilized
  - Superior Temperature Stability
  - Extremely Low Switch-Point Drift
  - Insensitive to Physical Stress
- ESD Protected to 5 kV
- Solid-State Reliability
- Small Size
- Easily Manufacturable with Magnet Pole Independence

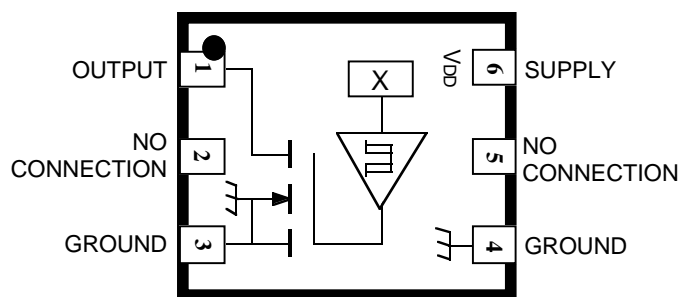

Always order by complete part number: the prefix 'A' + the basic four-digit part number + the suffix 'E' or 'L' to indicate operating temperature range + a suffix to indicate package style, e.g., **A3212ELH**.

**ELECTRICAL CHARACTERISTICS over operating voltage and temperature range (unless otherwise specified).**

Characteristic	Symbol	Test Conditions	Limits			
			Min.	Typ.	Max.	Units
Supply Voltage Range	$V_{DD}$	Operating <sup>1</sup>	2.5	2.75	3.5	V
Output Leakage Current	$I_{OFF}$	$V_{OUT} = 3.5 \text{ V}$ , $B_{RPN} < B < B_{RPS}$	–	<1.0	1.0	$\mu\text{A}$
Output On Voltage	$V_{OUT}$	$I_{OUT} = 1 \text{ mA}$ , $V_{DD} = 2.75 \text{ V}$	–	100	300	mV
Awake Time	$t_{awake}$		–	45	90	$\mu\text{s}$
Period	$t_{period}$		–	45	90	ms
Duty Cycle	d.c.		–	0.1	–	%
Chopping Frequency	$f_C$		–	340	–	kHz
Supply Current	$I_{DD(EN)}$	Chip awake (enabled)	–	–	2.0	mA
	$I_{DD(DIS)}$	Chip asleep (disabled)	–	–	8.0	$\mu\text{A}$
	$I_{DD(AVG)}$	$V_{DD} = 2.75 \text{ V}$	–	5.1	10	$\mu\text{A}$
		$V_{DD} = 3.5 \text{ V}$	–	6.7	10	$\mu\text{A}$

NOTES: 1. Operate and release points will vary with supply voltage.  
 2.  $B_{OPx}$  = operate point (output turns on);  $B_{RPx}$  = release point (output turns off).  
 3. Typical Data is at  $T_A = +25^\circ\text{C}$  and  $V_{DD} = 2.75 \text{ V}$  and is for design information only.

**MAGNETIC CHARACTERISTICS over operating voltage and temperature range (unless otherwise specified).**

Characteristic	Symbol	Test Conditions	Limits			
			Min.	Typ.	Max.	Units
Operate Points	$B_{OPS}$	South pole to branded side	–	37	55	G
	$B_{OPN}$	North pole to branded side	-55	-40	–	G
Release Points	$B_{RPS}$	South pole to branded side	10	31	–	G
	$B_{RPN}$	North pole to branded side	–	-34	-10	G
Hysteresis	$B_{hys}$	$ B_{OPx} - B_{RPx} $	–	5.9	–	G

NOTES: 1. Negative flux densities are defined as less than zero (algebraic convention), i.e., -50 G is less than +10 G.  
 2.  $B_{OPx}$  = operate point (output turns on);  $B_{RPx}$  = release point (output turns off).  
 3. Typical Data is at  $T_A = +25^\circ\text{C}$  and  $V_{DD} = 2.75 \text{ V}$  and is for design information only.  
 4. 1 gauss (G) is exactly equal to 0.1 millitesla (mT).

## FUNCTIONAL DESCRIPTION

**Low Average Power.** Internal timing circuitry activates the sensor for 45  $\mu$ s and deactivates it for the remainder of the period (45 ms). A short "awake" time allows for stabilization prior to the sensor sampling and data latching on the falling edge of the timing pulse. The output during the "sleep" time is latched in the last sampled state. The supply current is not affected by the output state.

Dwg. WH-017-2

**Chopper-Stabilized Technique.** The Hall element can be considered as a resistor array similar to a Wheatstone bridge. A large portion of the offset is a result of the mismatching of these resistors. These devices use a proprietary dynamic offset cancellation technique, with an internal high-frequency clock to reduce the residual offset voltage of the Hall element that is normally caused by device overmolding, temperature dependencies, and thermal stress. The chopper-stabilizing technique cancels the mismatching of the resistor circuit by changing the direction of the current flowing through the Hall plate using CMOS switches and Hall voltage measurement taps, while maintaining the Hall-voltage signal that is induced by the external magnetic flux. The signal is then captured by a sample-and-hold circuit and further processed using low-offset bipolar circuitry. This technique produces devices that have an extremely stable quiescent Hall output voltage, are immune to thermal stress, and have precise recoverability after temperature cycling. A relatively high sampling frequency is used for faster signal processing capability can be processed.

More detailed descriptions of the circuit operation can be found in: Technical Paper STP 97-10, *Monolithic Magnetic Hall Sensor Using Dynamic Quadrature Offset Cancellation* and Technical Paper STP 99-1, *Chopper-Stabilized Amplifiers With A Track-and-Hold Signal Demodulator*.

# 3212 MICROPOWER, ULTRA-SENSITIVE HALL-EFFECT SWITCH

## FUNCTIONAL DESCRIPTION (cont'd)

**Operation.** The output of this device switches low (turns on) when a magnetic field perpendicular to the Hall sensor exceeds the operate point  $B_{OPS}$  (or is less than  $B_{OPN}$ ). After turn-on, the output is capable of sinking up to 1 mA and the output voltage is  $V_{OUT(ON)}$ . When the magnetic field is reduced below the release point  $B_{RPS}$  (or increased above  $B_{RPN}$ ), the device output switches high (turns off). The difference in the magnetic operate and release points is the hysteresis ( $B_{hys}$ ) of the device. This built-in hysteresis allows clean switching of the output even in the presence of external mechanical vibration and electrical noise.

As used here, negative flux densities are defined as less than zero (algebraic convention), i.e., -50 G is less than +10 G.

**Applications.** Allegro's pole-independent sensing technique allows for operation with either a north pole or south pole magnet orientation, enhancing the manufacturability of the device. The state-of-the-art technology provides the same output polarity for either pole face.

It is strongly recommended that an external bypass capacitor be connected (in close proximity to the Hall sensor) between the supply and ground of the device to reduce both external noise and noise generated by the chopper-stabilization technique. This is especially true due to the relatively high impedance of battery supplies.

The simplest form of magnet that will operate these devices is a bar magnet with either pole near the branded surface of the device. Many other methods of operation are possible. Extensive applications information for Hall-effect sensors is available in:

- *Hall-Effect IC Applications Guide*, Application Note 27701;
- *Hall-Effect Devices: Soldering, Gluing, Potting, Encapsulating, and Lead Forming*, Application Note 27703.1;
- *Soldering of Through-Hole Hall-Sensor Devices*, Application Note 27703; and
- *Soldering of Surface-Mount Hall-Sensor Devices*, Application Note 27703.2.

All are provided in *Allegro Electronic Data Book*, AMS-702. or at
