74F651A Octal transceiver/register, inverting (3-State)
74F652A Octal transceiver/register, non-inverting (3-State)

FEATURES

- Combines 74F245 and two 74F374 type functions in one chip
- High impedance base inputs for reduced loading (70µA in high and low states)
- Independent registers for A and B buses
- Multiplexed real-time and stored data
- Choice of non-inverting and inverting data paths
- 3-State outputs
- Industrial temperature range available (–40°C to +85°C) for 74F652A

DESCRIPTION

The 74F651A and 74F652A transceivers/registers consist of bus transceiver circuits with 3–State outputs, D–type flip–flops, and control circuitry arranged for multiplexed transmission of data directly from the input bus or the internal registers. Data on the A or B bus will be clocked into the registers as the appropriate clock pin goes high. Output enable (OEAB, $\overline{OEBA}$) and select (SAB, SBA) pins are provided for bus management.

The following examples demonstrate the four fundamental bus-management functions that can be performed with the 74F651A and 74F652A. The select pins determine whether data is stored or transferred through the device in real time. The output enable pins determine the direction of the data flow.

BUS MANAGEMENT FUNCTIONS

Notes to function table

1. H = High-voltage level
2. L = Low-voltage level
3. * = The data output function may be enabled or disabled by various signals at the $\overline{OEBA}$ and OEAB inputs. Data input functions are always enabled, i.e., data at the bus pins will be stored on every low-to-high transition of the clock.
4. ↑ = Low-to-high clock transition
5. X = Don't care

ABSOLUTE MAXIMUM RATINGS

Operation beyond the limit set forth in this table may impair the useful life of the device.
Unless otherwise noted these limits are over the operating free air temperature range.

NOTES:

1. For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable type.
2. All typical values are at V_{CC} = 5V, T_{amb} = 25°C.
3. I_O is tested under conditions that produce current approximately one half of the true short–circuit output current (I_{OS}).
