GENERAL DESCRIPTION

The 74HC/HCT299 are high-speed Si-gate CMOS devices and are pin compatible with low power Schottky TTL (LSTTL). They are specified in compliance with JEDEC standard no. 7A.

The 74HC/HCT299 contain eight edge-triggered D-type flip-flops and the interstage logic necessary to perform synchronous shift-right, shift-left, parallel load and hold operations. The type of operation is determined by the mode select inputs (S₀ and S₁), as shown in the mode select table.

All flip-flop outputs have 3-state buffers to separate these outputs (I/O₀ to I/O₇) such, that they can serve as data inputs in the parallel load mode. The serial outputs (Q₀ and Q₇) are used for expansion in serial shifting of longer words.

A LOW signal on the asynchronous master reset input (MR) overrides the S_n and clock (CP) inputs and resets the flip-flops. All other state changes are initiated by the rising edge of the clock pulse. Inputs can change when the clock is either state, provided that the recommended set-up and hold times, relative to the rising edge of CP, are observed.

A HIGH signal on the 3-state output enable inputs ($\overline{OE}_1$ or $\overline{OE}_2$) disables the 3-state buffers and the I/O_n outputs are set to the high-impedance OFF-state. In this condition, the shift, hold, load and reset operations can still occur. The 3-state buffers are also disabled by HIGH signals on both S₀ and S₁, when in preparation for a parallel load operation.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	CONDITIONS	TYPICAL		UNIT
			HC	HCT	
t _{PHL} / t _{PLH}	propagation delay CP to Q ₀ , Q ₇ CP to I/O _n	C _L = 15 pF; V _{CC} = 5 V	20	19	ns
t _{PHL}	$\overline{MR}$ to Q ₀ , Q ₇ or I/O _n		20	19	ns

C _{I/O}	input/output capacitance		10	10	pF
C _{PD}	power dissipation capacitance per package	notes 1 and 2	120	125	pF

Notes

1. C_{PD} is used to determine the dynamic power dissipation (P_D in μW):

$$P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum (C_L \times V_{CC}^2 \times f_o) \text{ where:}$$

f_i = input frequency in MHz

f_o = output frequency in MHz

$\sum (C_L \times V_{CC}^2 \times f_o)$ = sum of outputs

C_L = output load capacitance in pF

V_{CC} = supply voltage in V

2. For HC the condition is V_I = GND to V_{CC}
For HCT the condition is V_I = GND to V_{CC} – 1.5 V
