Preface

Thank you very much for making use of Toshiba microcomputer LSIs.
Before use this LSI, refer the section, "Points of Note and Restrictions".
Especially, take care below cautions.

****CAUTION****

How to release the HALT mode

Usually, interrupts can release all halts status. However, the interrupts = ($\overline{\text{NMI}}$, INT0, INTRTC), which can release the HALT mode may not be able to do so if they are input during the period CPU is shifting to the HALT mode (for about 5 clocks of f_{FPH}) with IDLE1 or STOP mode (IDLE2 is not applicable to this case). (In this case, an interrupt request is kept on hold internally.)

If another interrupt is generated after it has shifted to HALT mode completely, halt status can be released without difficulty. The priority of this interrupt is compare with that of the interrupt kept on hold internally, and the interrupt with higher priority is handled first followed by the other interrupt.

3. Operation

The following describes block by block the functions and basic operation of TMP91CW11.

Notes and restrictions for each block are outlined in 7, “Use Precautions and Restrictions” at the end of this manual.

3.1 CPU

TMP91CW11 incorporates a high-performance 16-bit CPU (900/L1-CPU). For CPU operation, see the “TLCS-900/L1 CPU”.

The following describes the unique functions of the CPU used in TMP91CW11; these functions are not covered in the TLCS-900/L1 CPU section.

3.1.1 Reset

When resetting the TMP91CW11 microcontroller, ensure that the power supply voltage is within the operating voltage range, and that the internal high-frequency oscillator has stabilized. Then hold the $\overline{\text{RESET}}$ input to low level for at least 10 system clocks (ten states: 16 μs at 20 MHz), resetting initializes the clock gear to $f_c/16$.

When the reset is accepted, the CPU sets as follows:

- Sets as follows the program counter (PC) in accordance with the reset vector stored at address FFFF00H to FFFF02H:
 $\text{PC (7 to 0)} \leftarrow \text{data located at FFFF00H}$
 $\text{PC (15 to 8)} \leftarrow \text{data located at FFFF01H}$
 $\text{PC (23 to 16)} \leftarrow \text{data located at FFFF02H}$
- Sets the stack pointer (XSP) to 100H.
- Sets bits <IFF2 to 0> of the status register (SR) to 111 (sets the interrupt level mask register to level 7).
- Sets the <MAX> bit of the status register to 1 (MAX mode).
 (Note: As this product does not support a MIN mode, don't write 0 to <MAX>.)
- Clears bits <RFP2 to 0> of the status register to 000 (sets the register bank to 0).

When reset is released, the CPU starts executing instructions in accordance with the program counter settings. CPU internal registers not mentioned above do not change when the reset is released.

When the reset is accepted, the CPU sets internal I/O, ports, and other pins as follows.

- Initializes the internal I/O registers.
- Sets the port pins, including the pins that also act as internal I/O, to general-purpose input or output port mode.
- Sets $\overline{\text{WDTOUT}}$ pin to 0. (Resetting enables the watchdog timer.)
- Pulls up the CLK pin to high level.

(Note: During reset, do not reduce the external voltage level as this can cause malfunction.)

- Sets ALE pin to High Impedance (High-Z).

Note 1: By resetting, register in the CPU except program counter (PC), status register (SR) and stack pointer (XSP) and the data in internal RAM are not changed.

Note 2: The CLK pin is pulled up during reset. When the voltage is put down externally, there is possible to cause malfunctions.

Figure 3.1.1 shows the reset timing chart of TMP91CW11.

Figure 3.1.1 TMP91CW11 Reset timing chart

3.2 Memory Map

The TMP91CW11 uses an address space of 128 bytes as an internal I/O area, which is allocated to addresses 000000H to 00007FH. The CPU can access this internal I/O area with short instruction code using the direct addressing mode.

Figure 3.2.1 shows the memory map and the access ranges corresponding to the CPU addressing modes.

Note: After reset, the stack pointer XSP is set to 100H.

Figure 3.2.1 Memory map

4. Electrical Characteristics

4.1 Absolute Maximum Ratings

X used in an expression shows a frequency of clock f_{PH} selected by SYSCR1 <SYSCK>. If a clock gear or a low speed oscillator is selected, a value of X is different. The value as an example is calculated at f_c , gear = 1/ f_c (SYSCR1 <SYSCK, GEAR 2 to 0> = 0000).

Parameter	Symbol	Pin	Rating	Unit
Power Supply voltage	V_{CC}		–0.5 to 6.5	V
Input Voltage	V_{IN}		–0.5 to $V_{CC} + 0.5$	V
Output Voltage	V_{OUT}	P96, P97, PA0 to A5, P60, P91 to 93 (for open-drain)	–0.5 to $V_{CC} + 0.5$	V
Output Current (per pin)	I_{OUT1}	Only PA0 to A5	20	mA
	I_{OUT2}	Except PA0 to A5	2	mA
	I_{OUT3}		–2	mA
Output Current (total)	ΣI_{OUT1}	Total	120	mA
	ΣI_{OUT2}	PA0 to A5	80	mA
	ΣI_{OUT3}	Total	–80	mA
Power Dissipation ($T_a = 85^\circ\text{C}$)	P D		600	mW
Soldering Temperature	Tsolder		260	$^\circ\text{C}$
Storage Temperature	T_{STG}		–65 to 150	$^\circ\text{C}$
Operating Temperature	Topr		–40 to 85	$^\circ\text{C}$

Note: The absolute maximum ratings are rated values which must not be exceeded during operation, even for an instant. Any one of the ratings must not be exceeded. If any absolute maximum rating is exceeded, a device may break down or its performance may be degraded, causing it to catch fire or explode resulting in injury to the user. Thus, when designing products which include this device, ensure that no absolute maximum rating value will ever be exceeded.

$\overline{\text{BUSAK}}$ to Output Buffer is on.	t_{BAA}	0	80	0	80	0	80	ns

Note 1: The Bus will be released after the $\overline{\text{WAIT}}$ request is inactive, when the $\overline{\text{BUSRQ}}$ is set to 0 during Wait cycle.

Note 2: This line shows the output buffer is off-state. It doesn't indicate the signal level is fixed.

Just after the bus is released, the signal level which is set before the bus is released is kept dynamically by the external capacitance. Therefore, to fix the signal level by an external resistor during bus releasing, designing is executed carefully because the level - fix will be delayed.

The internal programmable pull-up/pull-down resistor is switched active/non-active by an internal signal.
