■ PIN ASSIGNMENT

■ PIN DESCRIPTION

Pin No.	Pin Name	I/O	Functions
1	OSC _{IN}	I	Oscillator input. Oscillator output. A crystal is placed between OSC _{IN} and OSC _{OUT} .
3	OSC _{OUT}	O	
4	V _P	—	Power supply input for charge pump and analog switch.
5	V _{CC}	—	Power supply voltage input.
6	D _O	O	Charge pump output. The characteristics of charge pump is reversed depending upon FC input.
7	GND	—	Ground.
8	LD	O	Phase comparator output. Normally this pin outputs high level. While the phase difference of fr and fp exists, this pin outputs low level.
10	fin	I	Prescaler input. The connection with an external VCO should be AC connection.
11	Clock	I	Clock input for 19-bit shift register and 16-bit shift register. On rising edge of the clock shifts one bit of data into the shift registers.
13	Data	I	Binary serial data input. The last bit of the data is a control bit which specified destination of shift registers. When this bit is high level and LE is high level, the data stored in shift register is transferred to 15-bit latch. When this bit is low level and LE is high level, the data is transferred to 18-bit latch.
14	LE	I	Load enable input (with internal pull up resistor). When LE is high or open, the data stored in shift register is transferred into latch depending upon the control bit. At the time, internal charge pump output is connected to BiSW pin because internal analog switch becomes ON state.
15	FC	I	Phase select input of phase comparator (with internal pull up resistor). When FC is low level, the characteristics of charge pump, phase comparator is reversed. FC input signal controls fout pin (test pin) output level, fr or fp.
16	BiSW	O	Analog switch output. Usually BiSW pin is set high-impedance state. When internal analog switch is ON (LE pin is high level), this pin outputs internal charge pump output.
17	fout	O	Minitor pin of phase comparator input. fout pin outputs either programmable reference divider output (fr) or programmable divider output (fp) depending upon FC pin input level. FC = H: It is the same as fr output level. FC = L: It is the same as fp output level.
18	φP	O	Output for external charge pump. The characteristics are reversed according to FC input. φP pin is N-channel open drain output.
20	φR	O	
2, 9 12, 19	NC	—	No connection.

■ FUNCTIONAL DESCRIPTIONS

1. Pulse Swallow Function

The divide ratio is set using the following equation.

$$f_{VCO} = [(M \times N) + A] \times f_{osc} \div R$$

f_{VCO} : Output frequency of external voltage controlled oscillator (VCO)

M : Preset modulus of external dual modulus prescaler (64 or 128)

N : Preset divide ratio of binary 11-bit programmable counter (16 to 2047)

A : Preset divide ratio of binary 7-bit swallow counter ($0 \leq A \leq 127$, $A < N$)

f_{osc} : Output frequency of the external reference frequency oscillator

R : Preset divide ratio of binary 14-bit programmable reference counter (8 to 16383)

2. Serial Data Input

Serial data input is achieved by three inputs, such as Data pin, Clock pin and LE pin. Serial data input controls 15-bit programmable reference divider and 18-bit programmable divider, respectively.

Binary serial data is input to Data pin.

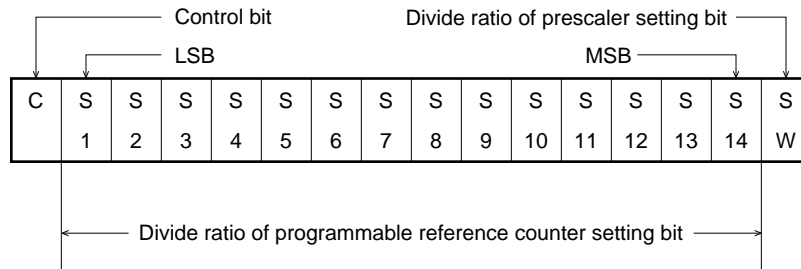

On rising edge of clock shifts one bit of serial data into the internal shift registers and when load enable pin is high level or open, stored data is transferred into latch depending upon the control bit.

Control data "H" data is transferred into 15-bit latch.

Control data "L" data is transferred into 18-bit latch.

(1) Programmable Reference Divider

Programmable reference divider consists of 16-bit shift register, 15-bit latch and 14-bit reference counter. Serial 16-bit data format is shown below.

3. Serial Data Input Timing

* : Paranthesis data is used for setting divide ratio of programmable reference divider.
On rising edge of clock shifts one bit of data in the shift register.

4. Phase Characteristics

FC pin is provided to change phase characteristics of phase comparator. Characteristics of internal charge pump output level (D_o), phase comparator output level (ϕ_R , ϕ_P) are reversed depending upon FC pin input level. Also, monitor pin (f_{OUT}) output level of phase comparator is controlled by FC pin input level. The relation between outputs (D_o , ϕ_R , ϕ_P) and FC input level are shown below.

	FC : "H" or open				FC : "L"			
	D_o	ϕ_R	ϕ_P	f_{out}	D_o	ϕ_R	ϕ_P	f_{out}
$f_r > f_p$	H	L	L	(f_r)	L	H	Z	(f_p)
$f_r = f_p$	Z	L	Z	(f_r)	Z	L	Z	(f_p)
$f_r < f_p$	L	H	Z	(f_r)	H	L	L	(f_p)

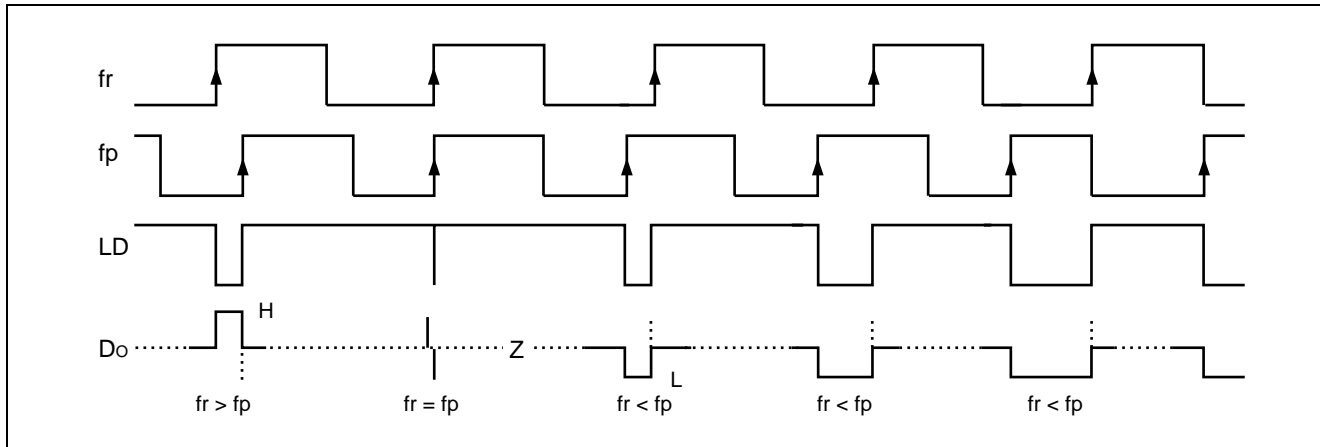

Note: Z = (High impedance)

Depending upon VCO characteristics, FC pin should be set accordingly:

- When VCO characteristics are like (1), FC should be set High or open circuit; When VCO characteristics are like (2), FC should be set Low.

Phase comparator output waveforms are shown below.

Notes: Phase difference detection range: -2π to $+2\pi$

Spike appearance depends on charge pump characteristics. Also, the spike is output in order to diminish dead band.

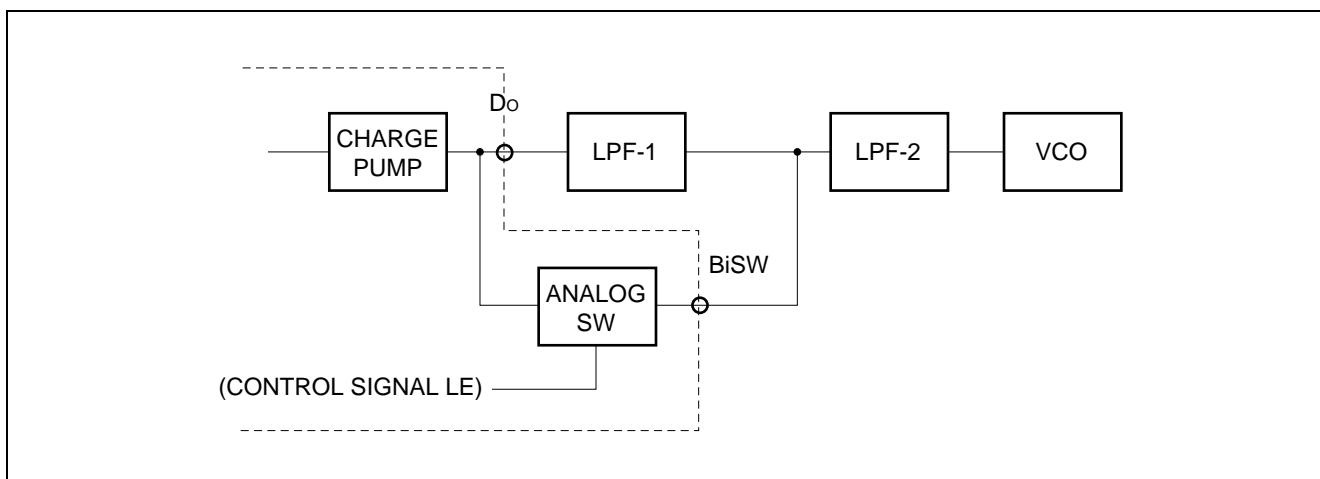

When $fr > fp$ or $fr < fp$, spike might not appear depending upon charge pump characteristics.

5. Analog Switch

ON/OFF of analog switch is controlled by LE input signal. When the analog switch is ON, internal charge pump output (D_o) is connected to BiSW pin. When the analog switch is OFF, BiSW pin is set to high-impedance state.

LE	Analog Switch
H (Changing the divide ratio of internal prescaler)	ON
L (Normal operation mode)	OFF

When an analog switch is inserted between LP1 and LP2, faster lock up times is achieved to reduce LPF time constant during PLL channel switching.
