

KM4270

Dual, Low Cost, +2.7V & +5V, Rail-to-Rail I/O Amplifier

Features at 2.7V

- 136 μ A supply current per amplifier
- 4.9MHz bandwidth
- Output swings to within 20mV of either rail
- Input voltage range exceeds the rail by >250mV
- 5.3V/ μ s slew rate
- 16mA output current
- 21nV/ $\sqrt{\text{Hz}}$ input voltage noise
- Directly replaces MAX4126, OPA2340, LMV822, and TLV2462 in single supply applications
- Available in SOIC-8 and MSOP-8 package options

Applications

- Portable/battery-powered applications
- PCMCIA, USB
- Mobile communications, cellular phones, pagers
- Notebooks and PDA's
- Sensor Interface
- A/D buffer
- Active filters
- Signal conditioning
- Portable test instruments

KM4270 Packages

General Description

The KM4270 is an ultra-low cost, low power, voltage feedback amplifier. At 5V, the KM4270 uses only 160 μ A of supply current per amplifier and is designed to operate from a supply range of 2.5V to 5.5V ($\pm 1.25\text{V}$ to 2.75V). The input voltage range exceeds the negative and positive rails.

The KM4270 offers high bipolar performance at a low CMOS price. The KM4270 offers superior dynamic performance with a 4.9MHz small signal bandwidth and 5.3V/ μ s slew rate. The combination of low power, high bandwidth, and rail-to-rail performance make the KM4270 well suited for battery-powered communication/computing systems.

The KM4170 (single) and KM4470 (quad) are also available.

Large Signal Frequency Response

Output Swing vs. Load

KM4270 Electrical Characteristics ($V_s = +2.7V$, $G = 2$, $R_L = 10k\Omega$ to $V_s/2$, $R_f = 5k\Omega$; unless noted)

Parameters	Conditions	TYP	Min & Max	UNITS	NOTES

General Description

The KM4270 is single supply, general purpose, voltage-feedback amplifier. The KM4270 is fabricated on a complimentary bipolar process, features a rail-to-rail input and output, and is unity gain stable.

The typical non-inverting circuit schematic is shown in Figure 1.

Figure 1: Typical Non-inverting Configuration

Input Common Mode Voltage

The common mode input range extends to 250mV below ground and to 250mV above V_S , in single supply operation. Exceeding these values will not cause phase reversal. However, if the input voltage exceeds the rails by more than 0.5V, the input ESD devices will begin to conduct. The output will stay at the rail during this overdrive condition. If the absolute maximum input voltage (700mV beyond either rail) is exceeded, externally limit the input current to $\pm 5\text{mA}$ as shown in Figure 2.

Figure 2: Circuit for Input Current Protection

Power Dissipation

The maximum internal power dissipation allowed is directly related to the maximum junction temperature. If the maximum junction temperature exceeds 150°C, some performance degradation will occur. If the maximum junction temperature exceeds 175°C for an extended time, device failure may occur.

Overdrive Recovery

Overdrive of an amplifier occurs when the output and/or input ranges are exceeded. The recovery time varies based on whether the input or output is overdriven and by how much the ranges are exceeded. The KM4270 will typically recover in less than 50ns from an overdrive condition. Figure 3 shows the KM4270 in an overdriven condition.

Figure 3: Overdrive Recovery

Driving Capacitive Loads

The **Frequency Response vs. C_L** plot, illustrates the response of the KM4270. A small series resistance (R_S) at the output of the amplifier, illustrated in Figure 4, will improve stability and settling performance. R_S values in the **Frequency Response vs. C_L** plot were chosen to achieve maximum bandwidth with less than 2dB of peaking. For maximum flatness, use a larger R_S . As the plot indicates, the KM4270 can easily drive a 50pF capacitive load without a series resistance.

Figure 4: Typical Topology for driving a capacitive load

Driving a capacitive load introduces phase-lag into the output signal, which reduces phase margin in the amplifier. The unity gain follower is the most sensitive configuration. In a unity gain follower configuration, the KM4270 requires a 510Ω series resistor to drive a 100pF load.

Layout Considerations

General layout and supply bypassing play major roles in high frequency performance. Fairchild has evaluation boards to use as a guide for high frequency layout and as aid in device testing and characterization. Follow the steps below as a basis for high frequency layout:

- Include 6.8 μ F and 0.01 μ F ceramic capacitors
- Place the 6.8 μ F capacitor within 0.75 inches of the power pin
- Place the 0.01 μ F capacitor within 0.1 inches of the power pin
- Remove the ground plane under and around the part, especially near the input and output pins to reduce parasitic capacitance
- Minimize all trace lengths to reduce series inductances

Refer to the evaluation board layouts shown in Figure 6 for more information.

Evaluation Board Information

The following evaluation boards are available to aid in the testing and layout of this device:

Eval Board	Description	Products
KEB006	Dual Channel, Dual Supply, 8 lead SOIC	KM4270IC8
KEB010	Dual Channel, Dual Supply, 8 lead MSOP	KM4270IM8

Evaluation board schematics and layouts are shown in Figure 5 and Figure 6.
